## 1 Section A. Introduction

*This section provides context on the purpose of the DATA SHARING COALITION and this document, as well as information on how to interpret this document.*

### 1 Reading guide

#### 1.1 About this document

This document is the HARMONISATION CANVAS, which presents the findings of an initial exploration of topics related to enable data sharing across domains. This exploration was conducted as a collaborative effort by participants of the DATA SHARING COALITION (DSC). The main purpose of the HARMONISATION CANVAS is to provide the basis for the development of the future CROSS-DOMAIN TRUST FRAMEWORK. See chapter 2.2 for more details.

#### 1.2 Intended audience

People and organisations that are a stakeholder in the development of the future TRUST FRAMEWORK are the main audience of this document.

However, as a standalone document, the HARMONISATION CANVAS can also provide interesting insights for:

- Participants of and people interested in the DATA SHARING COALITION in general
- People interested in what is required to facilitate (cross-sectoral) data sharing
- DATA SHARING DOMAINS that want to learn how to become interoperable with other DATA SHARING DOMAINS

#### 1.3 Typography

From this paragraph onwards, the typography in this document follows the following rules:

- Regular text appears like this
- DEFINED TERMS FROM THE GLOSSARY APPEAR LIKE THIS
- *References to other documents appear like this*

*Additional context given to content written in the document appears like this*

**Boxes:** are used to give examples and extension on certain content

34 1.4 Glossary

35 Table 1: Glossary

Glossary item	Definition
OBLIGATIONS AND ADVICE	POLICIES that are assessed and enforced after the establishment of a DATA SERVICE AGREEMENT, on what must be carried out after a data service is approved. Advice is similar to obligation with the difference that enforcement of the advice is not mandatory
ACCESS CONTROL RULES	POLICIES that are assessed and enforced prior to the establishment of a DATA SERVICE AGREEMENT, which regulate how DATA SERVICES can be accessed
AUTHENTICATION	The process where the validity of a claimed identity is verified
AUTHORISATION	The permissions or rights of an actor (humans, machines, proxies, etc.) to perform an action
DATA SERVICE	Any service offered by a DATA SERVICE PROVIDER aimed at exchanging or processing data (for example, this includes basic data services such as data pull, data push, bringing an algorithm to the data as well as complex use cases based on combinations of these basic types)
DATA SERVICE CONSUMER	The actor that makes use of a DATA SERVICE offered by the DATA SERVICE PROVIDER
DATA SERVICE PROVIDER	The actor that offers a DATA SERVICE to the DATA SERVICE CONSUMER
DATA SERVICE TRANSACTION AGREEMENT	The agreement (handshake) between a DATA SERVICE CONSUMER and DATA SERVICE PROVIDER to enable trust and accept the terms on which the DATA SERVICE transaction can take place
DATA SHARING	The act of exchanging data through a DATA SERVICE transaction between a DATA SERVICE PROVIDER and a DATA SERVICE CONSUMER
DATA SHARING COALITION (DSC)	A collaborative initiative that aims to enable organisations to easily share data across Domains
DATA SHARING INITIATIVE	Organisation that enables DATA SHARING in a certain DOMAIN by providing a coherent set of specifications and requirements and by providing supervision
DELEGATION	The provision of explicit rights (to perform an action) to a third party
DOMAIN	Flexibly defined as any number organisations collaboratively working together to share data to achieve a shared purpose

Glossary item	Definition
GUIDING PRINCIPLE	A principle that gives direction in the decision-making process of establishing and maintaining the content of the HARMONISATION CANVAS
HARMONISATION	Establishing common agreements, standards and requirements between actors to enable DATA SHARING between them
HARMONISATION CANVAS	This document
HARMONISATION DOMAIN	Network of PROXIES
IDENTIFICATION	The process of claiming an identity by a subject or the process of attributing/issuing an identity to a subject by an authority
IMPLIED REGULATION AND AGREEMENTS	Regulation and agreements that hold, but that is not explicitly stated in documentation such as agreement documentation and metadata
INFORMATION SECURITY	Mitigating risks of threat events through the implementation of technical or organisational information security measures
INITIATIVE	Synonym for DATA SHARING INITIATIVE
INTEROPERABILITY	The ability of systems of different actors, adhering to different standards and agreements, to exchange data in a meaningful way that is mutually understandable and satisfactory
POLICIES	Define rules for access to and usage of DATA SERVICES, can be split into ACCESS CONTROL RULES and OBLIGATION AND ADVICE. TERMS AND CONDITIONS are formalised into Policies
PROXY MODEL	Solution for multilateral INTEROPERABILITY across DOMAINS where different DATA SHARING DOMAINS implement PROXIES. The DSC will initially use this model for implementation of the Cross-DOMAIN Trust Framework
PROXY	A module that translates between specifications and requirements from a data sharing DOMAIN and Harmonised specifications and requirements (and vice versa) in order to achieve INTEROPERABILITY and trust across DOMAINS
SCHEME	Synonym for TRUST FRAMEWORK

<b>Glossary item</b>	<b>Definition</b>
TERMS AND CONDITIONS	Define the concepts as well as the duties and rights, the powers and liabilities that apply to the actors engaged in DATA SERVICE TRANSACTIONS
TRUST	A situation between actors where (perceived) risks are sufficiently reduced in order to enable data sharing. The amount of risk deemed as acceptably low is determined by each actor themselves and therefore varies between actors
TRUST FRAMEWORK	Enables many-to-many data sharing through business, legal, operational, functional and technical agreements, tools and processes which facilitate cross domain data sharing

## 37 **2 Context**

### 38 **2.1 About the DSC**

39 The DATA SHARING COALITION (DSC) is an open and growing, international initiative in  
40 which a large variety of organisations collaborate to unlock the value of CROSS-DOMAIN  
41 data sharing. The DSC aims to drive CROSS-DOMAIN DATA SHARING, by enabling  
42 INTEROPERABILITY between DOMAINS, thereby strengthening each DOMAIN.  
43

44 The coalition started in January 2020 and is facilitated by the Dutch Ministry of Economic  
45 Affairs and Climate policy. The expected lifespan of the project phase of the coalition is  
46 until 2025. By 2025, the DATA SHARING COALITION is expected to have transferred its  
47 activities to an entity that operates and governs any future frameworks and facilities  
48 developed by the DSC. The first and current phase of the DATA SHARING COALITION is a  
49 feasibility study into the HARMONISATION potential to enable CROSS-DOMAIN DATA SHARING.  
50 For more information on the DATA SHARING COALITION, visit: [www.datasharingcoalition.eu](http://www.datasharingcoalition.eu)  
51

### 52 **2.2 About the Harmonisation Canvas**

53 The HARMONISATION CANVAS, this document, provides the foundation for the future *Cross-*  
54 *Domain Trust Framework* and is the main deliverable of the first phase of the DATA  
55 SHARING COALITION that will run until Q2 2021. This is part of the feasibility study  
56 researching the potential for CROSS-DOMAIN DATA SHARING.  
57

58 The main goal of the HARMONISATION CANVAS is to serve as a first steppingstone for the  
59 further research into and development of common agreements between DOMAINS. The  
60 statements and findings presented in this document will provide guidance for future work  
61 of the DSC, but do not yet represent any binding agreements or requirements for future  
62 frameworks or other deliverables of the DSC. Further, due to the document's goals, the  
63 HARMONISATION CANVAS aims to give an indication of topics and their implication but does  
64 not aim to be exhaustive or to complete the detailing of these topics.  
65

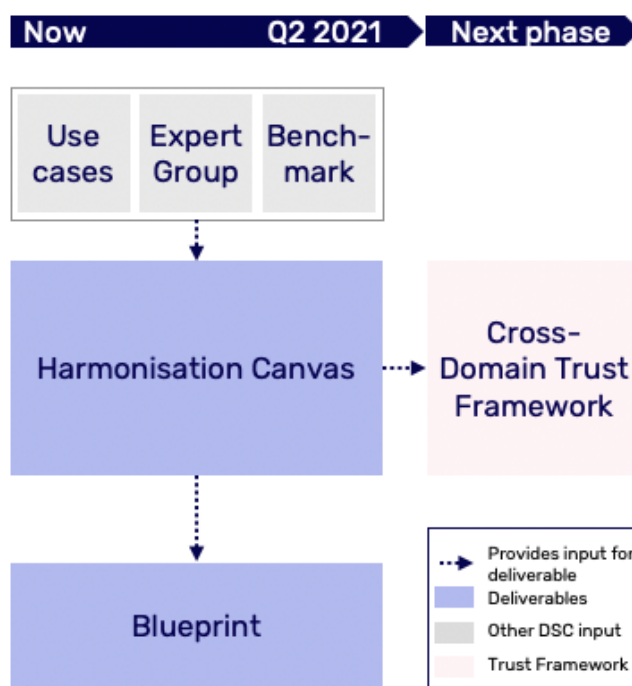

66 The HARMONISATION CANVAS captures the results of a collaborative exploration of what  
67 type of common agreements are required to achieve INTEROPERABILITY across DOMAINS.  
68 This includes determining the topics that require common agreements to achieve  
69 interoperability, the extent to which agreements are necessary for these topics and the  
70 gathering of best practices with regard to these future agreements.  
71

72 The content of the HARMONISATION CANVAS is a product of several activities of  
73 (participants of) the DATA SHARING COALITION. There are three main sources of input: Use  
74 cases, analysis of existing DATA SHARING INITIATIVES and expert input. All three sources of  
75 input are combined and discussed in the Expert Group of the DATA SHARING COALITION.  
76 This varied group of experts from different participants of the DSC meets regularly to  
77 discuss the contents of the HARMONISATION CANVAS. Together, through extensive  
78 discussions, collaborative research and knowledge sharing, they deliver input on what  
79 should be included in the HARMONISATION CANVAS. The three sources of input are:  
80

- 81
- 82
- 83
- 84
- 85
- 86
- 87
- 88
- 89
- 90
- 91
- 92
- 93
- 94
- 95
- 96
- 97
- 98
- 99
- 100
- 101
- Use cases: The DATA SHARING COALITION supports the realisation of five cross-sectoral use cases of DATA SHARING<sup>1</sup>. In these use cases, the aim is to realise INTEROPERABILITY across DOMAINS in a specific context. This provides practical insights into requirements for HARMONISATION across DOMAINS. Although INTEROPERABILITY requirements might be use case specific, the learnings from this use case will be generalised to fit a more generic context, before being included in the HARMONISATION CANVAS.
  - Expert input: For each topic, experts that are delegated by DSC participants provide input on their view of what is helpful to include in the Harmonisation Canvas. This can range from a recommendation of a certain market standard to input on the scope of future agreements or input for defining common concepts. See Table 6 for an overview of the experts who contributed to this document.
  - Analysis of existing DATA SHARING INITIATIVES: The DSC project team analyses how DATA SHARING INITIATIVES that are participating in the DSC are designed in relation to certain topics (e.g. requirements on identity proofing, standards used for metadata, etc.). This provides insights into the setup of different DATA SHARING INITIATIVES and therefore what is required for INTEROPERABILITY between these DATA SHARING INITIATIVES and DOMAINS in general.

## 2.3 Related documents

102 This HARMONISATION CANVAS is related to a number of other documents within the DATA SHARING COALITION. Figure 1 shows these relationships, and Table 2 gives an overview of the other documents and their status. The HARMONISATION CANVAS will provide input for two future documents, the DATA SHARING COALITION Blueprint and the CROSS-DOMAIN TRUST FRAMEWORK.

108  
109 *Figure 1: Relationship of the Harmonisation Canvas with other documents*

110

<sup>1</sup> <https://datasharingcoalition.eu/use-cases/>

111 *Table 2: Overview of documents related to the Harmonisation Canvas*

<b>Document</b>	<b>Description</b>	<b>Status</b>
DATA SHARING COALITION <i>Blueprint</i>	An overview of elements of DATA SHARING INITIATIVES, corresponding best practices and insights from the HARMONISATION CANVAS. This will inform, inspire and accelerate new and existing DOMAINS and support them in becoming INTEROPERABLE	To be included in the first phase of the DSC, to be completed by Q2 2021
<i>(Cross-Domain) Trust Framework</i>	A document that captures all HARMONISATION agreements in the DATA SHARING COALITION. This set of agreements is to be implemented by DOMAINS in order to achieve INTEROPERABILITY across DOMAINS	To be developed in the next phase of the DSC (after Q2 2021)

112

## 113 2.4 About the future Cross-Domain Trust Framework

114 In order to enable INTEROPERABILITY between DOMAINS, the DATA SHARING COALITION will  
 115 develop common, multilateral agreements on a wide range of relevant topics (e.g. digital  
 116 identities, legal context, metadata, etc.). DOMAINS which implement and adhere to these  
 117 multilateral agreements become INTEROPERABLE with each other. This enables DOMAINS to  
 118 facilitate their participants in sharing data with minimal efforts with actors from other  
 119 DOMAINS that have also agreed to adhere to these multilateral agreements.

120

121 The common agreements that will be made by the DATA SHARING COALITION will be  
 122 captured in one comprehensive document, the future *Cross-Domain Trust Framework*.  
 123 The document will specify agreements and requirements that DOMAINS should adhere to,  
 124 divided across five disciplines: Business, Legal, Operational, Functional and Technical  
 125 (BLOFT), see Box 1 for an overview of the BLOFT model and included topics. An indicative  
 126 overview of the contents and structure of the future *Cross-Domain Trust Framework* can  
 127 be found in Figure 2.

128

129 *Note: More detail on the expected contents of the future Cross-Domain Trust*  
 130 *Framework will be included at a later stage, as the development of the Harmonisation*  
 131 *Canvas will provide more insights into this*

132

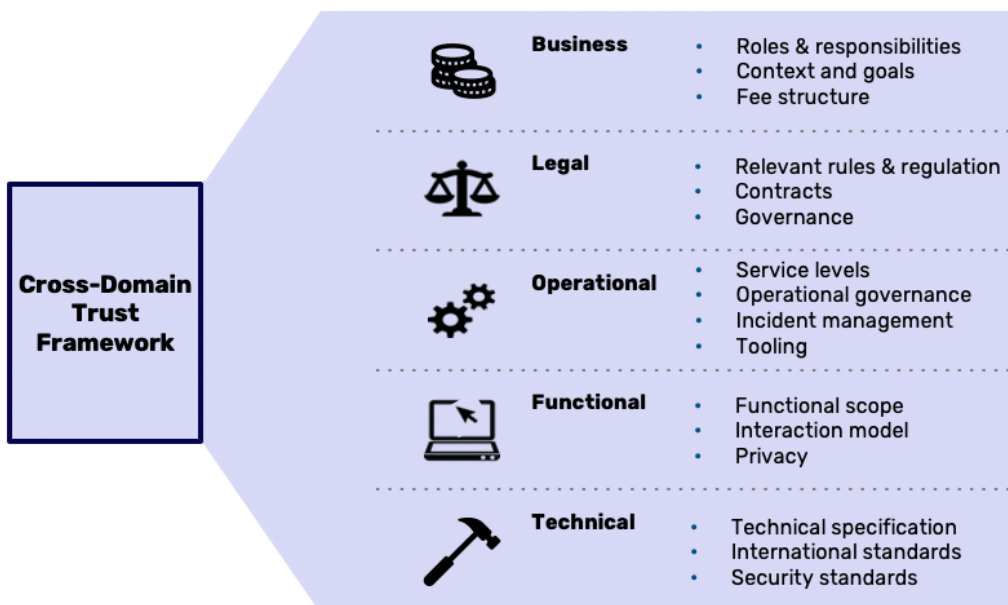

Figure 2: Preliminary content and structure of the future Cross-Domain Trust Framework

133  
134

135  
136

**Box 1: Complete BLOFT Framework**

The BLOFT model has been developed based on experience in the creation of trust frameworks in the past. It contains an extensive list of topics that together form a starting point to create a blueprint for a trust framework. See Figure 3 for a high-level overview of the topics included within the model.

Figure 3: Overview of topics in the BLOFT model

142

143

144

145

146

147

148

At first glance, this model gives a comprehensive overview. In practice, the separation of topics and elements is not as clear as indicated as there is overlap between topics and topics can be discussed from different perspectives. Therefore, this extensive BLOFT model is used as a starting point to ensure diverse topics are discussed within this phase of the Data Sharing Coalition, but deviations may be implemented as needed.

149

## 150 2.5 Next steps

151 In the next phase of the DATA SHARING COALITION, this HARMONISATION CANVAS will act as  
152 input for the development of the CROSS-DOMAIN TRUST FRAMEWORK. This development  
153 process will require an iterative, collaborative approach with a wide range of stakeholders  
154 involved. In the future process of co-creating the CROSS-DOMAIN TRUST FRAMEWORK, the  
155 common concepts and best practices from this HARMONISATION CANVAS will be used as  
156 input and will be detailed further into concrete standards and requirements.

157

158 The exact timelines and approach of these next steps will be determined in the run up to  
159 the next phase of the DATA SHARING COALITION, which is expected to start in Q3 of 2021.

160

### 161 **3 Guiding principles**

162 A number of principles will be used to guide the creation of the HARMONISATION CANVAS  
163 and future CROSS-DOMAIN TRUST FRAMEWORK. They provide a basis for decision-making;  
164 however, the GUIDING PRINCIPLES are no absolute truth or hard requirements but need to  
165 be considered in the context of each decision. In no particular order, the following five  
166 principles have been identified:

- 167 • Future proof
- 168 • Trustworthy
- 169 • Inclusive
- 170 • As generic as possible, as specific as needed
- 171 • Cost-efficient

172

#### 173 **3.1 Future proof**

##### 174 Statement

175 The CROSS-DOMAIN TRUST FRAMEWORK should be future proof and therefore extensible and  
176 non-static.

177

##### 178 Rationale

179 A future proof design entails a TRUST FRAMEWORK which supports different  
180 implementations and is, to some extent, able to cater for changes in technology, user  
181 behaviour, regulation and for a growing number of DATA SERVICE transactions. An  
182 adaptive, extensible and non-static design enables scalability of the TRUST FRAMEWORK.

183

##### 184 Objectives

- 185 1. Create a cooperative DOMAIN that allows participants to innovate their services.
- 186 2. Support scalable and fully INTEROPERABLE participant implementation.

187

#### 188 **3.2 Trustworthy**

##### 189 Statement

190 The TRUST FRAMEWORK should be designed and maintained in a way that establishes trust  
191 for all participants and organisations, fitting the transaction context.

192

##### 193 Rationale

194 Trust is required on all levels of the Trust Framework in order to achieve wide-reaching  
195 adoption. Trust is required across DOMAINS and on a transactional level in order to  
196 facilitate CROSS-DOMAIN DATA SERVICE transactions.

197

##### 198 Objectives

- 199 1. Enable TRUST between actors within the future cross-DOMAIN network through  
200 compliance with the TRUST FRAMEWORK. This facilitates a basic reduction of risks  
201 between participants to enable a basic level of TRUST.
- 202 2. Ensure that data is used for authorised purposes only, as controlled by the data  
203 owner.
- 204 3. Define levels of trust dependent on a transaction context to perform a transaction.
- 205 4. Facilitate the use of required data security and privacy mechanisms.
- 206 5. Be transparent towards participants and related organisations.

- 207 6. Be transparent in process and dispute resolution.  
208 7. Install measures/sanctions against participants and related organisations  
209 violating trust.  
210

### 211 3.3 Inclusive

#### 212 Statement

213 The CROSS-DOMAIN TRUST FRAMEWORK should be generic, usable and feasible to all  
214 organisations or DOMAINS, regardless of sector and DATA SHARING context.  
215

#### 216 Rationale

217 Inclusivity is fundamental to enabling solution independent DATA SHARING across DOMAINS  
218 and organisations. It ensures diversity by providing a level playing field and comparable  
219 opportunities for incomparable organisations. Inclusivity leads to collaborative  
220 advantages across all DOMAINS.  
221

#### 222 Objectives

- 223 1. Neutrality by ensuring a non-discriminatory approach and policies towards all  
224 organisations, users and contexts.  
225 2. Cater for different levels of maturity of DOMAINS and their participants.  
226 3. Create a level playing field for participants.  
227

### 228 3.4 As generic as possible, as specific as needed

#### 229 Statement

230 The CROSS-DOMAIN TRUST FRAMEWORK rules should be as generic as possible and as  
231 specific as needed, taking into account different transaction contexts.  
232

#### 233 Rationale

234 This principle is needed to keep the TRUST FRAMEWORK as lightweight as possible in order  
235 to drive adoption. It ensures that participants are not held back by restricting agreements  
236 in order to keep implementation costs low. Furthermore, it ensures a broad reach  
237 amongst sectors and types of organisations.  
238

#### 239 Objectives

- 240 1. Maximise the competitive DOMAIN by minimising the collaborative DOMAIN  
241 requirements.  
242 2. Keep the TRUST FRAMEWORK as lightweight as possible.  
243 3. Minimise risk of over-engineering.  
244 4. Ensure solutions are generic to enable as many use cases as possible.  
245

### 246 3.5 Cost-efficient

#### 247 Statement

248 The CROSS-DOMAIN TRUST FRAMEWORK should be cost-efficient.  
249

#### 250 Rationale

251 Controlling costs is essential in a collaborative DOMAIN as it enables a fast and effective  
252 development. It lowers the threshold for organisations to participate and enables long-  
253 term sustainable participation.

254

255 Objectives

- 256 1. Enable cost savings by participants, for example, in terms of value or effort.  
257 2. Use proven and open standards where possible.  
258 3. Learn from (inter)national best practices.  
259 4. Ensure a transparent cost and benefit structure.  
260 5. Minimise cost of entrance and impact of implementation.  
261 6. Strive for the lowest possible impact for participants when changes occur in the  
262 future.

## 263 4 Interoperability and harmonisation

264

265 *This section presents the Coalition's initial views on the topics of the common*  
 266 *agreements in the future Cross-Domain TRUST FRAMEWORK and how they could be*  
 267 *implemented in order to achieve INTEROPERABILITY across DOMAINS. It is useful to have a*  
 268 *preliminary idea of what the final interoperability model will look like so that topics and*  
 269 *concepts can be discussed specifically within a practical context to avoid deeply*  
 270 *theoretical discussions. The exact manifestation and functionality of this model will be*  
 271 *detailed in the future TRUST FRAMEWORK*

272

### 273 4.1 Data sharing

274 DATA SHARING is the act of exchanging data through a DATA SERVICE between a DATA  
 275 SERVICE PROVIDER and a DATA SERVICE CONSUMER. DATA SERVICES exist in a variety of  
 276 different forms. See Table 3 for a non-exhaustive overview of the basic data service  
 277 types. These basic data services can be combined to realise more complex use cases.  
 278 For example, a single use case can include multiple data pull services to combine data  
 279 from a number of different sources. Note that data sharing through these data services  
 280 can be considered as a transactional data sharing model. Therefore, the act of performing  
 281 these data services can be called a DATA SERVICE TRANSACTION. The alternative of a data  
 282 publication model, where data should be available at all times for access by a DATA  
 283 SERVICE CONSUMER, can be captured within this model as a data pull transaction.

284

285 *Table 3: A non-exhaustive overview of data service types*

Data Service	Description
DATA PULL	The data service consumer acquires data from the data service provider so that the consumer can make use of the data
Data Push	The data service consumer pushes their data to a data service provider so that the provider can make use of the data
Algorithm Pull / Data visiting	The data service consumer requests an algorithm from the data service provider to be sent so that it can process data. The data service consumer remains in control of the data at all times
Algorithm Push / Data visiting	The data service consumer pushes an algorithm to a data service provider so that the algorithm can process the data. The data service provider remains in control of the data at all times

286

287

288

289 Table 4 presents some concrete examples of how DATA SHARING is done/can be done in  
 290 different DOMAINS and explicitly describes who has the roles of DATA SERVICE CONSUMER  
 291 and DATA SERVICE PROVIDER.

292

293

294

295

296 Table 4: Data sharing examples

Use case		Data service type	Data service consumer	Data service provider
Tax administration	Accountants can push their client's income, VAT and profit tax data towards the tax authority such that the tax authorities, in the role of data service provider, can process tax returns automatically. The accountants push the data to the tax authority	Data Push	Accountants	Tax authority
Green Loans	A house owner wants to share data from his smart energy meter with his loan advisor and prospect loan provider so that he can obtain a loan for energy saving measures (e.g. solar panels). The loan advisor pulls the data from smart meter.	Data Pull	Intermediary (loan advisor)	DSO (Distribution System Operator)

#### 298 4.1.1 Data Service Transaction

299

300 As part of each DATA SERVICE TRANSACTION between a DATA SERVICE CONSUMER and a DATA  
 301 SERVICE PROVIDER, an AGREEMENT between the parties must be established, see Figure 4  
 302 (See Appendix 8.1 for the steps to reach a DATA SERVICE TRANSACTION AGREEMENT). This  
 303 DATA SERVICE TRANSACTION AGREEMENT is specific to the transaction context and can be  
 304 considered a handshake between the actors to confirm trust and the mutual acceptance

<sup>2</sup> e-CMR stands for e-“Convention relative au Contrat de Transport International de Marchandises par Route”

305 of the specific TERMS AND CONDITIONS under which the DATA SERVICE TRANSACTION takes  
 306 place. In addition to the characteristics of the DATA SERVICE itself, many topics are  
 307 relevant for the DATA SERVICE TRANSACTION AGREEMENT including, but not limited to:  
 308 Identification, Authentication & Authorisation, Terms and Conditions, legal context, and  
 309 security aspects. See Section B: Harmonisation topics, for further details about each  
 310 topic. Coming to an agreement regarding this wide variety of topics is a complex and  
 311 time-consuming process between organisations.  
 312

313  
314

Figure 4: Overview of a Data service, including the DATA SERVICE TRANSACTION AGREEMENT

## 315 4.2 Interoperability and Harmonisation

316 Whenever organisations collaborate, they can make agreements with each other as they  
 317 see fit to facilitate this collaboration. Within the context of the Data Sharing Coalition, a  
 318 DOMAIN is flexibly defined as any number of organisations collaboratively working  
 319 together to share data to achieve a shared purpose. Examples include, but are not limited  
 320 to:

- 321 • An initiative (e.g. a scheme or platform) which facilitates data sharing between
- 322 100+ participant organisations,
- 323 • Organisations which share data due to legal requirements, (e.g. sharing financial
- 324 data under PSD2)
- 325 • A small number of organisations which bilaterally share data with each other
- 326 based on proprietary standards,

327

328 The DATA SHARING COALITION aims to also enable DATA SERVICE TRANSACTIONS across  
 329 DOMAINS between actors that are part of different DOMAINS and despite of the fact not all  
 330 agreements between the Domains have been harmonised. This is enabled by a concept  
 331 known as INTEROPERABILITY; *“The ability of systems of different actors, adhering to*  
 332 *different standards and agreements, to exchange data in a way that is mutually*  
 333 *satisfactory”*. There are multiple approaches to achieve INTEROPERABILITY.

334

335 In theory, full HARMONISATION of DOMAINS is the ideal solution to enable data sharing  
 336 across DOMAINS. In essence, this forms a new overarching DOMAIN to facilitate DATA  
 337 SHARING. This means that existing DATA SHARING INITIATIVES adjust their own  
 338 requirements and implementations to follow a common, cross-DOMAIN design. However,  
 339 HARMONISATION across INITIATIVES would impact all current INITIATIVE participants as they

340 would need to adjust existing implementations which worked well in the isolated context  
341 of their own DOMAIN, requiring significant investments. Given the impact (in effort and  
342 cost) it would have on their participants, immediate adoption of fully harmonised  
343 agreements by individual INITIATIVES will most likely be limited.  
344

345 Another option that does not require full HARMONISATION of all DOMAINS, is that individual  
346 organisations organise their own CROSS-DOMAIN INTEROPERABILITY for their use cases. For  
347 this, they would need bilateral agreements with organisations from another DOMAIN and  
348 define and implement their own interoperable requirements. Such bilateral agreements  
349 will allow their single use case for CROSS-DOMAIN DATA SHARING but are dependent on  
350 individual participants implementing specific harmonised solutions and will therefore  
351 limit large scale CROSS-DOMAIN DATA SHARING.  
352

353 Therefore, the DATA SHARING COALITION initially aims for INTEROPERABILITY between  
354 DOMAINS instead of full HARMONISATION. In order to enable CROSS-DOMAIN  
355 INTEROPERABILITY, new agreements that hold between DOMAINS should be defined. This  
356 will enable a DATA SERVICE PROVIDER in one DOMAIN to provide a DATA SERVICE to a DATA  
357 SERVICE CONSUMER in another DOMAIN, while limiting impact for both DATA SERVICE  
358 PROVIDER and DATA SERVICE CONSUMER.  
359

360 In order to enable CROSS-DOMAIN DATA SHARING and reduce the impact on existing  
361 INITIATIVES and their participants, the DSC foresees a new role: a PROXY. The role of a  
362 PROXY is to absorb the complexity of INTEROPERABILITY for the existing INITIATIVES and  
363 participants as much as possible. by implementing all INTEROPERABILITY.  
364

### 365 4.3 The Proxy Model

366  
367 *The proxy model is the working hypothesis for a model to solve cross-domain*  
368 *interoperability. Its exact functionalities are not specifically defined yet and are subject*  
369 *to change*

370  
371 A more practical solution to enable many-to-many INTEROPERABILITY across DOMAINS is  
372 for each DOMAIN to implement PROXIES. PROXIES are modules which are to be used by  
373 every DOMAIN with the function of translating between DOMAIN specific specifications and  
374 common, HARMONISED specifications.  
375

376 The main functionality of the PROXIES is to translate DOMAIN specific transactions to their  
377 harmonised equivalents:

- 378 • PROXIES will translate DOMAIN specific language to a harmonised language in the  
379 HARMONISATION DOMAIN to enable multilateral INTEROPERABILITY.
- 380 • PROXIES will facilitate trust across DOMAINS by conforming to the rules and  
381 agreements of the future TRUST FRAMEWORK.
- 382 • PROXIES will make use of compatible technical standards that enable  
383 communication between PROXIES.
- 384 • PROXIES will contain reference to all other functionalities and DATA SERVICES of  
385 participants within different DOMAINS in a Cross-Domain DATA SERVICE Registry.  
386

387 The PROXIES implemented by all DOMAINS form a network, the HARMONISATION DOMAIN,  
 388 which enables each DOMAIN to share data effortlessly with other DOMAINS. The PROXY  
 389 network will facilitate an INTEROPERABLE transaction capability and a common  
 390 understanding on concepts like data and trust across DOMAINS. The future CROSS-DOMAIN  
 391 TRUST FRAMEWORK will define the common agreements on the setup of these PROXIES.  
 392

393 Note that this many-to-many Proxy model solution does not exclude further bilateral  
 394 agreements and technical implementations between DOMAINS. However, as this is not  
 395 scalable, it shall not be included within the future TRUST FRAMEWORK.  
 396

397 The PROXIES will be implemented by the individual DOMAINS that adhere to the CROSS-  
 398 DOMAIN TRUST FRAMEWORK. Figure 5 shows a visual representation of the PROXY MODEL.  
 399

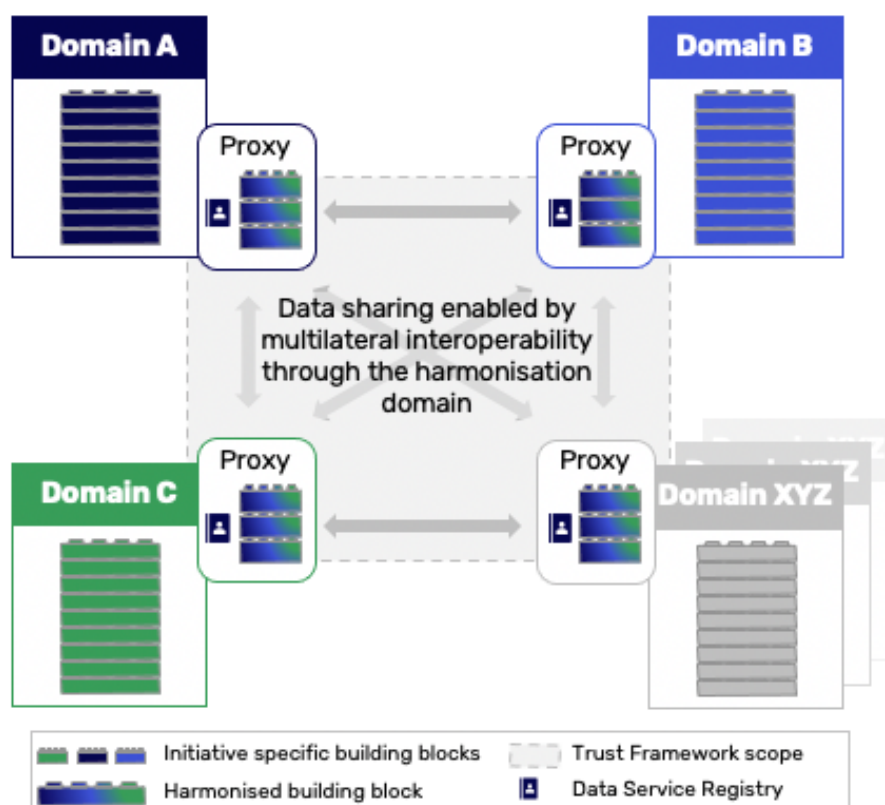

Figure 5: Visual representation Proxy Model

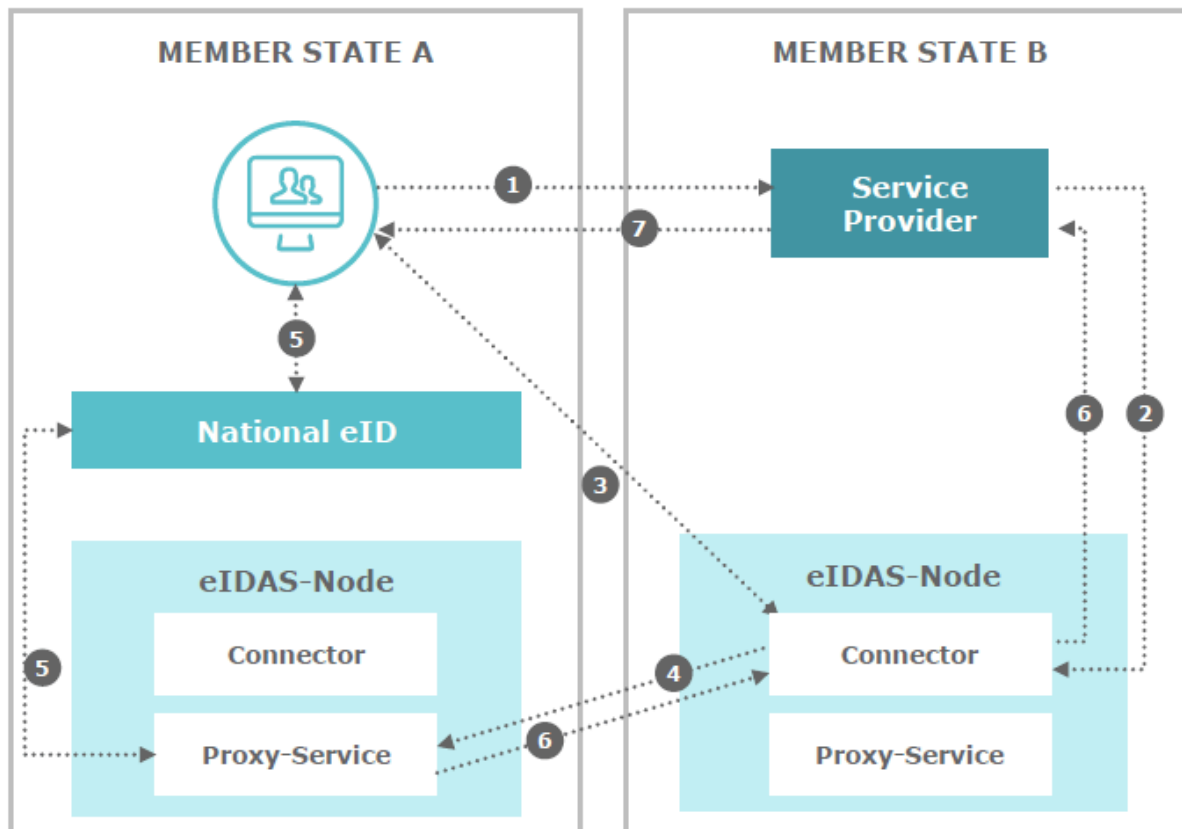

400  
401

402 Similar uses of PROXIES to enable CROSS-DOMAIN INTEROPERABILITY are already applied at  
 403 scale in multiple contexts, see Box 1 for an example in the use of proxies in eIDAS.  
 404 However, a PROXY MODEL is no silver bullet. Whether data will be shared across DOMAINS  
 405 will always depend on case specifics and decisions made by individual participants.  
 406

407  
408  
409  
410  
411  
412

**Box 1: Proxying in eIDAS**

The eIDAS-nodes, formerly known as 'Pan European PROXY Server' (PEPS) are an implementation of proxies used to enable INTEROPERABILITY of digital identities across EU member states. Figure 6 shows how eIDAS Nodes are used between two member states.

413

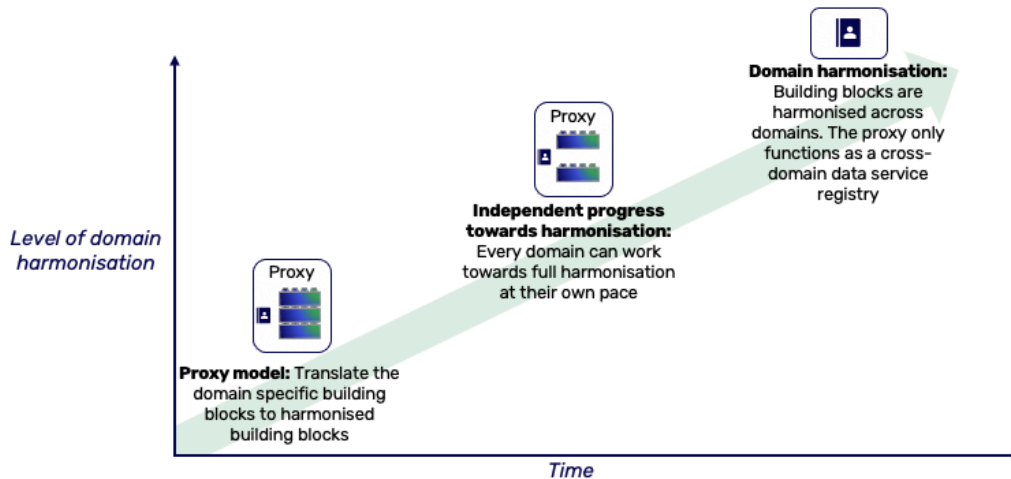

Figure 6: Overview of the eIDAS AUTHENTICATION scheme depicting eIDAS Nodes, Source: <https://docs.wso2.com/display/IS570/Electronic+Identification%2C+Authentication+and+Trust+Services+Regulation>

414  
415  
416  
417  
418  
419

eIDAS is based on well-established standards, such as SAML, to achieve INTEROPERABILITY and high security between EU member states. EU member states use different national eID solutions, that often involve nation specific implementations. The eIDAS Nodes translate the specific national solutions such that they can be understood across borders.

420  
421  
422  
423  
424  
425  
426  
427  
428  
429

The PROXY model further serves as a foundation for future developments from DOMAIN INTEROPERABILITY towards full DOMAIN HARMONISATION through a phased approach. Individual DOMAINS can work towards full HARMONISATION at their own pace, following their own change management processes. The initial implementation of PROXIES will be complex, but in time, the functionality of a PROXY will become lighter, as the HARMONISED components are transferred and embedded within the DOMAIN. Eventually, a PROXY only needs to carry out the function of CROSS-DOMAIN DATA SERVICE Registry when all other elements are HARMONISED within the DOMAIN. See Figure 7 for the possible development of PROXIES.

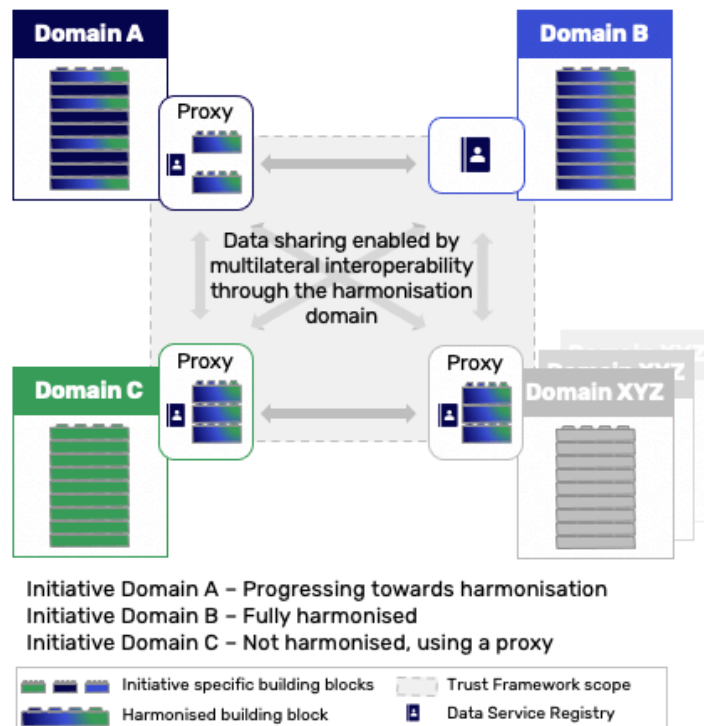

430  
431

Figure 7: Development from the PROXY MODEL to full HARMONISATION

432 It is impossible for DOMAINS to progress towards full HARMONISATION at the same pace, as  
 433 DOMAINS depend on the implementation pace of their participants. However, the PROXY  
 434 model enables DOMAINS to remain fully interoperable at different levels of progression  
 435 towards full HARMONISATION. This is as the rules and agreements which hold for fully  
 436 HARMONISED DOMAINS are the same as those for DOMAINS with PROXY MODEL  
 437 implementations. Therefore, data can be shared across DOMAINS irrespective of the pace  
 438 of progression, Further, these rules and agreements can be easily adopted by new  
 439 DOMAINS or organisations that are aiming to share data to ease their internal development,  
 440 meaning they may be fully harmonised from the initial development. See Figure 8 for a  
 441 visual representation with DOMAINS in different levels of progression towards full  
 442 HARMONISATION.

443

444  
445  
446

## 447 **Section B: Harmonisation topics**

448

449 *In this section, topics related to DATA SHARING are discussed that will need to be*  
 450 *included in the future Cross-DOMAIN TRUST FRAMEWORK. Each chapter will describe a*  
 451 *specific topic, explain the relevance for cross-domain interoperability and present*  
 452 *findings that provide the basis for agreements in the future Cross-DOMAIN TRUST*  
 453 *FRAMEWORK.*

454

455 *Note: More chapters will be added to this section in the coming period, once the DATA*  
 456 *SHARING COALITION Expert Group has discussed more topics.*

## 457 **5 Terms and conditions**

### 458 **5.1 Introduction**

459 TERMS AND CONDITIONS define the concepts, duties, rights, powers and liabilities that apply  
 460 to the actors on both sides of a DATA SERVICE TRANSACTION that are captured in a DATA  
 461 SERVICE TRANSACTION AGREEMENT. TERMS AND CONDITIONS are formalised into POLICIES,  
 462 which can be split into ACCESS CONTROL RULES, OBLIGATIONS AND ADVICE (see Figure 9). A  
 463 DATA SERVICE'S TERMS AND CONDITIONS are set by the DATA SERVICE PROVIDER directly  
 464 and/or are (partially) a result of the rules of the DATA SHARING DOMAINS the DATA SERVICE  
 465 PROVIDER belongs and adheres to.

466

467

468 *Figure 9: TERMS AND CONDITIONS are formalised in POLICIES, which can be split into ACCESS CONTROL RULES and*  
 469 *OBLIGATIONS AND ADVICE*

### 470 **5.2 Relevance**

471 To enable INTEROPERABILITY, the DATA SERVICE CONSUMER needs to understand the TERMS  
 472 AND CONDITIONS of a DATA SERVICE in general and a specific DATA SERVICE TRANSACTION as  
 473 specified and communicated by the DATA SERVICE PROVIDER, ideally in a machine-  
 474 readable format. Therefore, it is required that TERMS AND CONDITIONS (formalised into  
 475 POLICIES) can be interpreted across DOMAINS, such that individual POLICIES and the pieces  
 476 of evidence that demonstrate adherence to these POLICIES can be mapped to DOMAIN  
 477 specific POLICIES and evidence and vice versa. To achieve this, a shared understanding of  
 478 and language for POLICIES and evidence is needed.

479

480 Within a single DOMAIN, not everything that participants should adhere to is made explicit.  
 481 Adherence criteria can also be part of rule books, legislation or certifications relevant to  
 482 the DOMAIN, known as IMPLIED REGULATION AND AGREEMENTS. In this case, both the DATA  
 483 SERVICE PROVIDER and DATA SERVICE CONSUMER operating within the same DOMAIN are  
 484 aware of these IMPLIED REGULATION AND AGREEMENTS. Participants in other DOMAINS are not  
 485 expected to be aware of these DOMAIN specific IMPLIED REGULATION AND AGREEMENTS.  
 486 Therefore, to enable CROSS-DOMAIN DATA SERVICE TRANSACTION AGREEMENTS, these  
 487 IMPLIED REGULATIONS AND AGREEMENTS may need to be made explicit. DATA SERVICE

488 PROVIDERS may decide to make (parts of) the IMPLIED REGULATION AND AGREEMENTS explicit  
 489 and require explicit proof of adherence to those IMPLIED REGULATION AND AGREEMENTS.

490

## 491 5.3 Description

492

493 *Note: This chapter will further explain the topic based on discussions with the experts*  
 494 *involved in the Expert Group.*

495

496 This chapter explains the need for a shared language and understanding on POLICIES in  
 497 5.3.1 and the split of POLICIES in 5.3.2.

498

### 499 5.3.1 Creation of a shared language and understanding

500 A shared language and understanding is needed to enable unambiguous communication  
 501 on POLICIES and evidence that demonstrates the adherence to these POLICIES. It is not  
 502 realistic to expect to create a shared language for all individual POLICIES given their variety  
 503 across DOMAINS. A solution might be to create POLICY clusters and levels of adherence to  
 504 POLICY clusters (to express an assurance level). These POLICY clusters might make it  
 505 easier to define a shared language, as the clusters and levels might enable simple  
 506 comparison across DOMAINS.

507

508 POLICY clusters are sets of POLICIES, in which POLICIES belong to the same cluster if they  
 509 pursue the same objective. See Appendix 9.2 for a first set-up of POLICY clusters. POLICY  
 510 cluster levels define whether a Domain meets specific criteria within a POLICY cluster,  
 511 based on underlying POLICIES. POLICY cluster levels are formed differently for each cluster  
 512 and can be defined along different axes (e.g. nominal, ordinal and interval) based on DATA  
 513 SERVICE PROVIDER requirements.

514

515 POLICY clusters and POLICY levels should be further explored and defined in the next  
 516 phase of the DSC, once work on the future CROSS-DOMAIN TRUST FRAMEWORK starts.

517

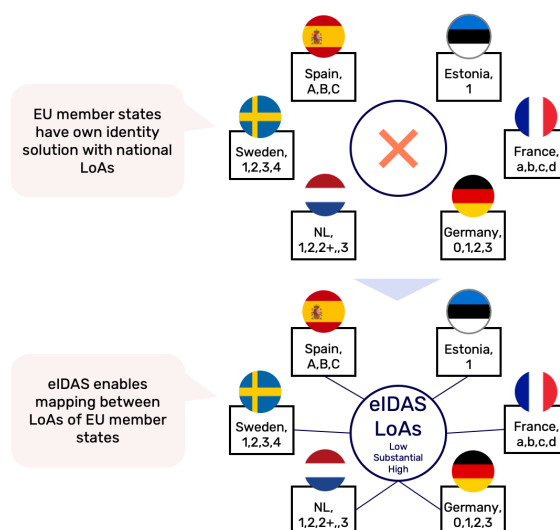

518 In the eIDAS Trust Framework, the principle of creating a shared language for POLICIES via  
 519 clusters and levels for clusters is applied at scale. This is further detailed in Box 2.

520 **Box 2: eIDAS**

521 In the last 15-20 years, most EU member states have developed their own national  
 522 digital identity solutions for citizen AUTHENTICATION based on member state specific  
 523 requirements, resulting in member state specific Levels of Assurance (LoAs) for their  
 524 digital identity.

525  
 526 In line with Europe’s ambition to create one Digital Single Market, the European Union  
 527 strived to enable people and businesses to use their own national electronic  
 528 IDENTIFICATION schemes (eIDs) to access public services available online in other EU  
 529 countries. To achieve this, the EU has created the common eIDAS<sup>3,4</sup> framework.

530  
 531 The variety of POLICIES and LoAs across countries initially made it impossible to create a  
 532 shared language on individual POLICIES across EU member states. The eIDAS framework  
 533 allows for mapping of national eID solutions and its member state specific LoAs to  
 534 generic eIDAS LoAs, enabling INTEROPERABILITY.

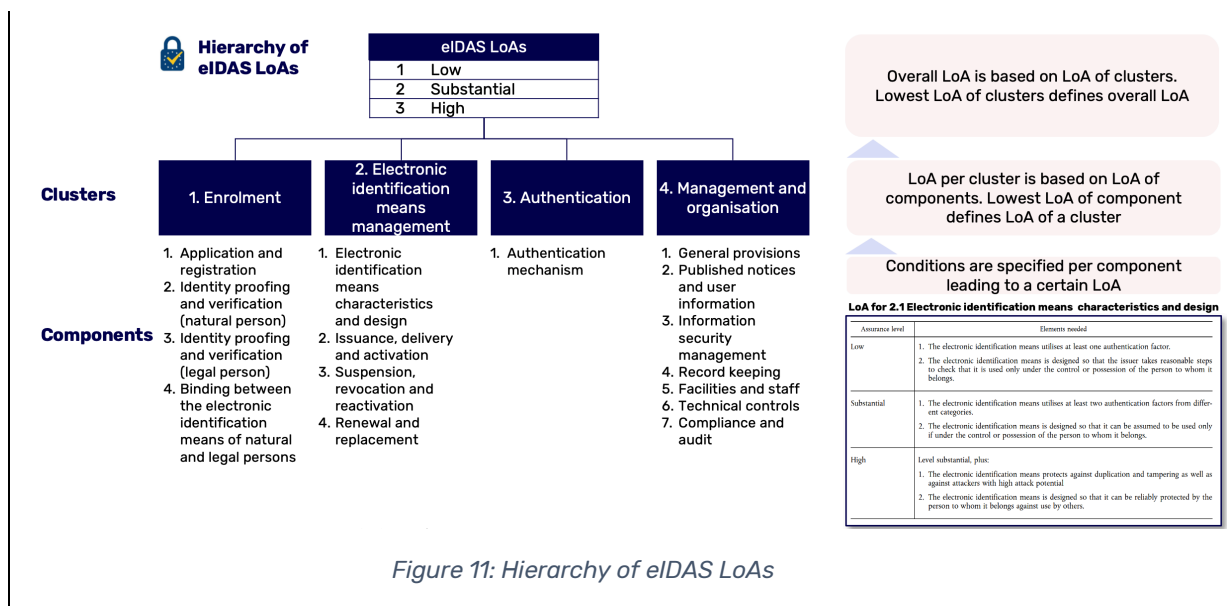

535  
 536 *Figure 10: Creation of a mapping between Levels of Assurance in EU member states*  
 537

538 eIDAS POLICY clusters consist of multiple components, with underlying POLICIES. The  
 539 overall LoA of eIDs will be based on the LoA of a number of clusters, where the lowest  
 540 LoA of the individual clusters will determine the overall LoA. Each cluster contains a  
 541 number of components, and the LoA of the cluster will be based on the lowest LoA of all  
 542 the components. Per component, conditions are specified defining how a LoA can be  
 543 reached.

544  
 545

<sup>3</sup> **eIDAS** (electronic **I**dentification, **A**uthentication and trust **S**ervices) is an EU regulation on electronic identification and trust services for electronic transactions in the European Single Market

<sup>4</sup> **Source:** Commission implementing regulation (EU) 2015/1502, Office journal of the European Union

546  
547  
548  
549

### 5.3.2 Policies

TERMS AND CONDITIONS are formalised into POLICIES, which can be split into ACCESS CONTROL RULES and OBLIGATIONS AND ADVICE, depending on whether the POLICIES are enforced before or after the DATA SERVICE AGREEMENT is established.

#### Access control rules

ACCESS CONTROL RULES are POLICIES that are assessed and enforced prior to establishing the DATA SERVICE AGREEMENT. Some ACCESS CONTROL RULES are in place to assess the likelihood of adherence to IMPLIED REGULATION AND AGREEMENTS (e.g. sector regulation and frameworks and general laws and regulation, through certifications and audit reports).

Examples of ACCESS CONTROL RULES:

- Subject attributes (e.g. LoA of identity, role and age)
- Context/environment attributes (e.g. location and time)
- Proof of security certifications (e.g. ISO 27001)

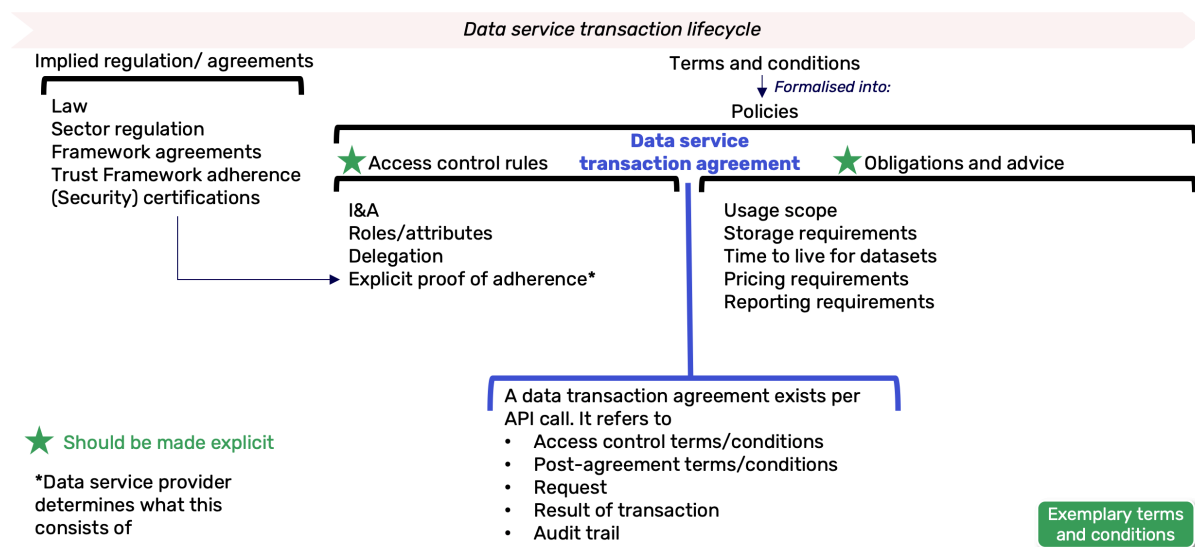

#### Obligations and advice

OBLIGATIONS AND ADVICE are POLICIES that are assessed and enforced after the DATA SERVICE AGREEMENT is established. They prescribe future requirements and optional guidance to the DATA SERVICE CONSUMER. It is up to the DATA SERVICE PROVIDER (or the Domain rules to which the DATA SERVICE PROVIDER adheres to) to determine whether a POLICY is OBLIGATION or ADVICE. Policy enforcement may vary (e.g. none, ad-hoc checks or by audit). Examples of OBLIGATIONS AND ADVICE POLICIES:

- Usage scope
- Storage requirements
- Time to live for datasets (deletion of data)
- Pricing and other financial (reporting) requirements
- Operational reporting requirements

See Appendix 9.1 for an overview of POLICIES split into ACCESS CONTROL RULES and OBLIGATION AND ADVICE within DSC use cases.

580  
 581 Figure 12 provides an overview of the relationship between a DATA SERVICE TRANSACTION  
 582 AGREEMENT, the associated transaction (the API call) and the TERMS AND CONDITIONS  
 583 (formalised into POLICIES) within a DATA SERVICE transaction lifecycle.  
 584  
 585 The term 'data transaction lifecycle' is introduced as a term to distinguish between the  
 586 sequence in which POLICIES should be adhered to and the actual DATA SERVICE  
 587 TRANSACTION.  
 588

589  
 590 *Figure 12: DATA SERVICE TRANSACTION lifecycle with a DATA SERVICE TRANSACTION AGREEMENT and POLICIES*

591 It is expected that only ACCESS CONTROL RULES and OBLIGATION AND ADVICE POLICIES will be  
 592 specified in a DATA SERVICE TRANSACTION AGREEMENT, as these are relevant for the  
 593 execution of a single API call.

594  
 595 In the next phase, once work on the future CROSS-DOMAIN TRUST FRAMEWORK starts, it  
 596 should be explored to what detail IMPLIED REGULATION AND AGREEMENTS should be made  
 597 explicit.

## 598 **6 Identification, Authentication and Authorisation**

### 599 **6.1 Introduction**

600 In order for actors to reach a DATA SERVICE TRANSACTION AGREEMENT, they must be able to  
601 identify, authenticate and authorise other actors. It is required that actors are able to  
602 identify those they are interacting with and assess their assurance level (for  
603 IDENTIFICATION and AUTHENTICATION) and know what permissions those other parties have  
604 (AUTHORISATION). ACCESS POLICIES define whether an entity should be permitted access to  
605 an object (target data, database access, algorithm access, etc.). ACCESS CONTROLS are the  
606 mechanisms and methods used to enforce ACCESS POLICIES using AUTHORISATION. Within  
607 DOMAINS, various types of IDENTIFICATION, AUTHENTICATION and AUTHORISATION  
608 mechanisms are used and while this suffices for activities within a specific DOMAIN,  
609 it is not trivial how these mechanisms and the resulting statements and evidence can find  
610 their way to another DOMAIN.

611

### 612 **6.2 Relevance**

613 When creating a HARMONISATION DOMAIN, PROXIES in different DOMAINS should be able to  
614 identify, authenticate and authorise one another in order to facilitate trusted, CROSS-  
615 DOMAIN DATA SHARING. This will be part of the future creation of the Trust Framework.

616

617 In order to facilitate end-2-end CROSS-DOMAIN INTEROPERABILITY, IDENTIFICATION,  
618 AUTHENTICATION and AUTHORISATION from one DOMAIN needs to be transportable to  
619 another DOMAIN in a trustworthy manner. To enable this, a shared, mutually  
620 understandable language needs to be created.

621

#### 622 **6.2.1 Identification**

623 Actors must be able to establish the identity of actor(s) from other DOMAIN(s) in order to  
624 determine the actor with whom a transaction is initiated. Currently, various INITIATIVES  
625 have different working implementations of IDENTIFICATION and AUTHENTICATION  
626 mechanisms. Table 5 gives a non-exhaustive overview of the various IDENTIFICATION and  
627 AUTHENTICATION solutions implemented by INITIATIVES.

628 **Table 5: Overview of how identification and AUTHENTICATION are organised within initiatives**

			<b>SIVI</b>

\* Indicate initiative specific implementations

629  
630

631 Table 5 shows that the INITIATIVES use different identifiers. In order to enable CROSS-  
632 DOMAIN DATA SHARING, there must be a mutual understanding of identifiers between  
633 DOMAINS such that DATA SERVICE TRANSACTION AGREEMENTS can be made. If the DOMAINS  
634 can understand each other's identities, a challenge remains in trusting the identities from  
635 another DOMAIN. Therefore, a mechanism should be in place that allows the DOMAINS to  
636 validate the authenticity of identities received from other DOMAINS for different types of  
637 actors which could initiate a DATA SERVICE TRANSACTION.

638

### 639 6.2.2 Authentication

640 DATA SERVICE PROVIDERS can set requirements for the level of assurance of  
641 AUTHENTICATION required from their DATA SERVICE CONSUMERS. When those consumers  
642 reside in other DOMAINS, the AUTHENTICATION information (including LoA) must be  
643 communicated and mapped to the DATA SERVICE PROVIDER'S LoA definitions.

644

### 645 6.2.3 Authorisation

646 For DATA SERVICE PROVIDERS to be able to make proper AUTHORISATION decisions regarding  
647 DATA SERVICE CONSUMERS residing in another DOMAIN, the information required for those  
648 decisions (attributes, roles, DELEGATION information and/or other information and  
649 decisions) must be communicated and mapped to the DATA SERVICE PROVIDER'S language  
650 and definitions.

651 **6.3 Description**

652

653 *Note: This chapter will further explain the topic based on discussions with the experts*  
 654 *involved in the expert group.*

655

656 This chapter explains the need for a shared language and understanding in the topics of  
 657 IDENTIFICATION, AUTHENTICATION and AUTHORISATION. This includes discussions on  
 658 identifiers in 6.3.1, assessing identity levels of assurance in 6.3.2, types of  
 659 AUTHENTICATION in 6.3.3 roles in AUTHORISATION in 6.3.4, AUTHORISATION sequences in  
 660 6.3.5 and delegated authority in 6.3.6.

661

662 **6.3.1 Identifying actors**

663

664 The use of different types of identifiers for the same types of actors could lead to  
 665 situations where one organisation has two different identifiers across DOMAINS, or where  
 666 identifiers that look exactly the same refer to different organisations. When interacting  
 667 across DOMAINS, this leads to ambiguity which will lead to errors, see Box 3 for an example.

668

669 Ambiguity between identifiers across DOMAINS can be solved by explicitly specifying the  
 670 type of identifier used in all CROSS-DOMAIN communication. Explicit specification can be  
 671 achieved by including a defining prefix to all identifiers in the INTEROPERABILITY DOMAIN,  
 672 see Box 3 for a detailed description. The exact method of including the prefix, and the  
 673 standardisation of the sharing of this data should be detailed in the TRUST FRAMEWORK.

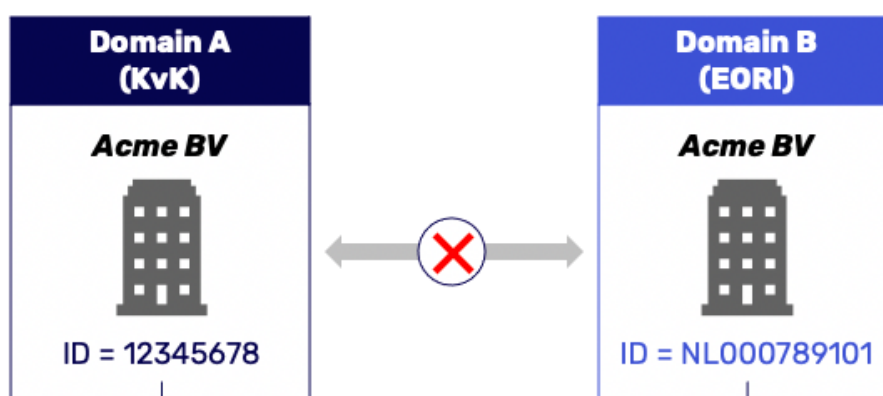

674

675

**Box 3: Ambiguous identifiers**

676

677 See Figure 13 for an example situation. Acme BV is participant in both DOMAIN A and  
 678 DOMAIN B. DOMAIN A uses the KvK number (Chamber of Commerce number in the  
 679 Netherlands) as identifier, DOMAIN B uses the EORI number (IDENTIFICATION number for  
 business in the European Union).

Different identifiers for the same organisation. Without explanation, this is ambiguous and will lead to errors if transactions across domains take place

680

681

*Figure 13: Ambiguity in identifiers should be resolved*

682

This ambiguity in used identifiers across domains can be resolved through the use of an identifier pre-fix as shown in Figure 14.

683

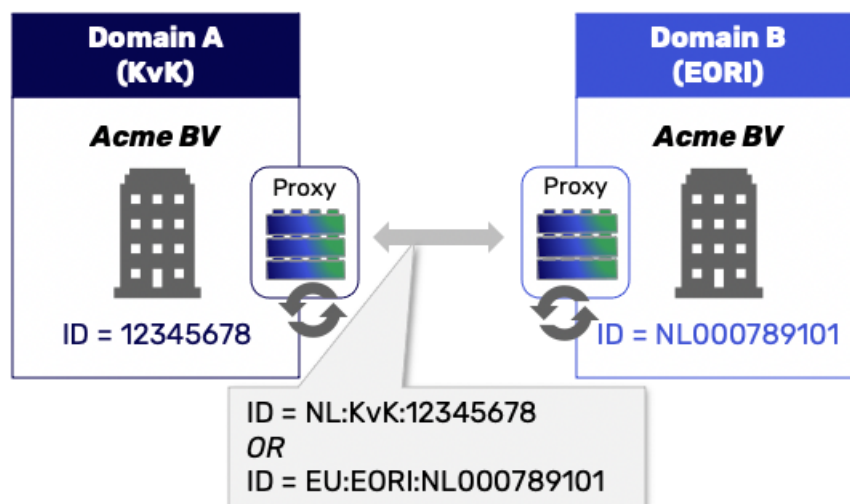

Figure 14: Using prefixes for communication of IDs across domains solves ambiguity

684  
685  
686

In addition to adding a prefix, proxies could map identifiers from their DOMAIN to identifiers of other DOMAINS. Mapping of identifiers can be done in order to establish the identity of an organisation with a different identifier in another DOMAIN or to distinguish the identities of organisations with a similar identifier in another DOMAIN to open services for them. As of now, it is unsure whether there will be use cases that require the mapping of identifiers. If these use cases are identified, the mapping of identifiers will be included in the future CROSS-DOMAIN TRUST FRAMEWORK.

694  
695  
696  
697  
698

The future CROSS-DOMAIN TRUST FRAMEWORK shall contain a number of best practices for INTEROPERABILITY solutions regarding identifiers. These best practices will be further detailed in the CROSS-DOMAIN TRUST FRAMEWORK

### 6.3.2 Assessing identity assurance

Actors must be able to understand the level of assurance that is associated with an identity received from another DOMAIN in order to determine whether the requested action can be performed.

703  
704  
705  
706  
707  
708

For digital identity solutions, eIDAS has solved the INTEROPERABILITY of Levels of Assurance (LoA) at an EU member state level, see Box 2 for a detailed description. eIDAS allows EU member states with member state specific identity solutions with specific LoAs to be mapped to generic eIDAS LoAs in order to enable INTEROPERABILITY.

The eIDAS framework with 3 LoAs (low, substantial, high) shall be used as a basis for interoperable LoAs in the TRUST FRAMEWORK. This is because the eIDAS framework is widely adopted already and has become the de facto standard for electronic IDENTIFICATION for eGovernment purposes in Europe.

713

### 6.3.3 Authentication

Actors must be able to exchange identity information with each other. Depending on the type of actors involved, there are two different types of AUTHENTICATION: Machine-to-

717 machine AUTHENTICATION and Human-to-machine AUTHENTICATION. Machine-to-machine  
718 AUTHENTICATION can be further specified to proxy-to-proxy AUTHENTICATION and  
719 AUTHENTICATION between a DATA SERVICE CONSUMER (machine) and a DATA SERVICE  
720 PROVIDER.

721

#### 722 [Machine-to-machine Authentication](#)

723 An AUTHENTICATION mechanism is required between machines (machine-to-machine,  
724 M2M) in order to autonomously authenticate each other's identity. This AUTHENTICATION  
725 should take place for each transaction context and without a need for human interaction.

726

727 An example of machine-to-machine authentication is in the usage of an IoT device  
728 service where the device must authenticate to the service servers. In the TRUST  
729 Framework, machine-to-machine authentication occurs when proxies communicate  
730 with each other and must authenticate themselves.

731

732 In order to facilitate INTEROPERABILITY, the TRUST FRAMEWORK should define a common  
733 machine-to-machine AUTHENTICATION method that all proxies can make use of. eIDAS  
734 Qualified Trust Services are anchored in EU law and widely used in Europe. Specifically,  
735 the Qualified Website AUTHENTICATION Certificates (QWAC) and Qualified Seal are relevant  
736 to facilitate M2M AUTHENTICATION methods. These eIDAS Qualified Trust Services could be  
737 used as a basis in the TRUST FRAMEWORK.

738

739 A Qualified Website AUTHENTICATION Certificate is a digital certificate which ensures the  
740 authenticity and data integrity of a connection and can be used to authenticate PROXIES  
741 before a connection is made. A Qualified Seal is a signature which ensures the sender's  
742 non-repudiation and integrity of messages.

743

744 To ensure a correct usage of Qualified Trust Services, cybersecurity experts will be asked  
745 to provide insights and design principles so that these are implemented correctly for M2M  
746 AUTHENTICATION within the TRUST FRAMEWORK.

747

#### 748 [Human-to-machine Authentication](#)

749 An AUTHENTICATION mechanism (human-to-machine, H2M) is in place between natural  
750 acting persons and the DOMAIN that they are a part of. However, when transacting across  
751 DOMAINS, it may be necessary for natural acting persons to authenticate themselves in  
752 DOMAINS other than the one they are located in. DOMAINS should facilitate a customer  
753 journey to enable this. Natural acting persons in various DOMAINS should therefore be able  
754 to be redirected to perform AUTHENTICATION in other DOMAINS within a single customer  
755 journey.

756

757 An example of human-to-machine AUTHENTICATION is a log-in to an online service by  
758 using a Facebook account (via OAuth). In the TRUST Framework, human-to-machine  
759 authentication occurs when a natural acting person has to log in to a service to perform  
760 an action. The person logs in a single time, requiring interaction, to set up a session during  
761 which they can perform the action, possibly consisting of multiple interactions, without  
762 having to authenticate themselves at every step.

763

764 AUTHENTICATION is always performed within a specific DOMAIN and therefore, there is no  
 765 need to organise H2M AUTHENTICATION across DOMAINS. However, it will occur that a  
 766 natural acting person (human) must authenticate themselves in a DOMAIN they are not  
 767 present in, while initiating the transaction. In order to facilitate the transaction, the  
 768 natural acting person needs to be redirected to the authorising DOMAIN to authenticate.  
 769 The PROXIES should facilitate this redirect. To ensure a consistent user experience, User  
 770 Experience (UX) Requirements should be defined for H2M AUTHENTICATION. The  
 771 requirements for this redirect functionality by PROXIES and the UX-requirements for  
 772 IDENTIFICATION and AUTHENTICATION (and also AUTHORISATION) should be included in the  
 773 TRUST FRAMEWORK.

774

#### 775 [Forwarding Authentication to another Domain](#)

776 For both H2M and M2M AUTHENTICATION, it may be required to transfer AUTHENTICATION  
 777 attributes across DOMAINS. For example, this may be needed in order to prove actor roles  
 778 within another DOMAIN. This insight has yet to be discussed within the Expert Group but  
 779 will be picked up before development of the future TRUST FRAMEWORK.

780

#### 781 [6.3.4 Roles in Authorisation](#)

782 Once the identity of the DATA SERVICE CONSUMER has been determined with a sufficient  
 783 level of assurance, the DATA SERVICE PROVIDER must determine what actions they allow  
 784 the consumer to perform. This is what AUTHORISATION the DATA SERVICE CONSUMER has.  
 785 For the DATA SERVICE PROVIDER to determine AUTHORISATION, a number of different  
 786 functional roles are established, each with their own responsibilities. Table provides an  
 787 overview of these roles and responsibilities and Box 4 provides an illustration of an  
 788 AUTHORISATION flow.

789

790 *Table 5: Overview of Authorisation roles and responsibilities*

Roles	Responsibilities
<b>PAP</b> (Policy Administration Point)	The Policy Administration Point is where administrators, developers and business users can create and manage AUTHORISATION policies in order to be used by the PDP.
<b>PEP</b> (Policy Enforcement Point)	The Policy Enforcement Point is responsible for protecting the object by executing the access control decision. It intercepts API requests and forwards them on to the PDP.
<b>PDP</b> (Policy Decision Point)	The Policy Decision Point evaluates received AUTHORISATION requests against AUTHORISATION policies using extra information if needed. All decisions reached are returned to the PEP.
<b>PIP</b> (Policy Information Point)	The Policy Information Point is any underlying information source of (meta)data such as databases, user directories and AUTHENTICATION details relevant for the AUTHORISATION. If PEP provides insufficient data to PDP, additional information can be retrieved via the PIP

791

792

793  
794  
795  
796

**Box 4: Illustration of Authorisation roles functionality**

The following example AUTHORISATION flow model can be applied to most AUTHORISATION methods and provides a usable framework as basis for describing AUTHORISATION concepts.

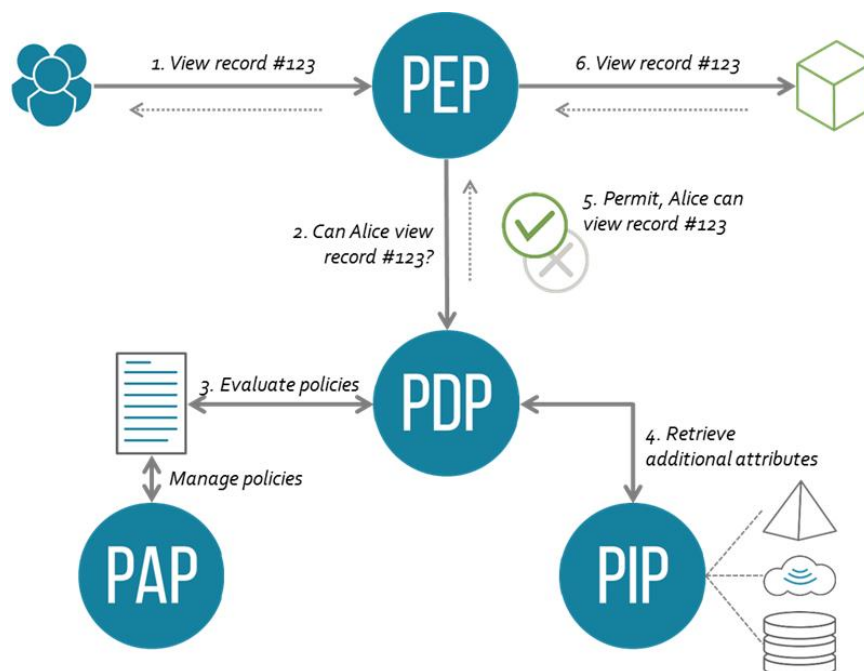

Figure 15: Example Authorisation flow as defined in the XACML standards  
Source: [https://www.oasis-open.org/committees/tc\\_home.php?wg\\_abbrev=xacml](https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=xacml)

797  
798  
799  
800  
801  
802  
803  
804  
805  
806  
807  
808  
809

1. A user sends a request which is intercepted by the Policy Enforcement Point (PEP).
2. The PEP converts the API request into an AUTHORISATION request.
3. The PEP forwards the AUTHORISATION request to the Policy Decision Point (PDP).
4. The PDP evaluates the AUTHORISATION request against the loaded policies. The policies are managed by the Policy Administration Point (PAP). If needed, it also retrieves attribute values from underlying Policy Information Points (PIP).
5. The PDP reaches a decision (Permit / Deny / NotApplicable / Indeterminate) and returns it to the PEP.
6. The PEP enforces the decision and processes the request; in the case of a Permit, access is granted.

Note: This is a simplified model, and other AUTHORISATION flows exist. See chapter 6.3.5 for more examples.

810  
811  
812  
813  
814  
815  
816  
817  
818  
819  
820  
821  
822

In practice, there is often not just a single implementation of several of the AUTHORISATION roles. For example, there can be multiple PDPs which each take partial AUTHORISATION decisions which collectively can lead to a final AUTHORISATION decision. Furthermore, there are often multiple PIPs, each providing different sets of information to the PDPs as needed. For CROSS-DOMAIN AUTHORISATION, these roles (PIPs and PDPs) can even be implemented in different DOMAINS. Depending on the choice of possible distribution of the roles across DOMAINS, INTEROPERABILITY requirements are needed to facilitate the implementation of the roles.

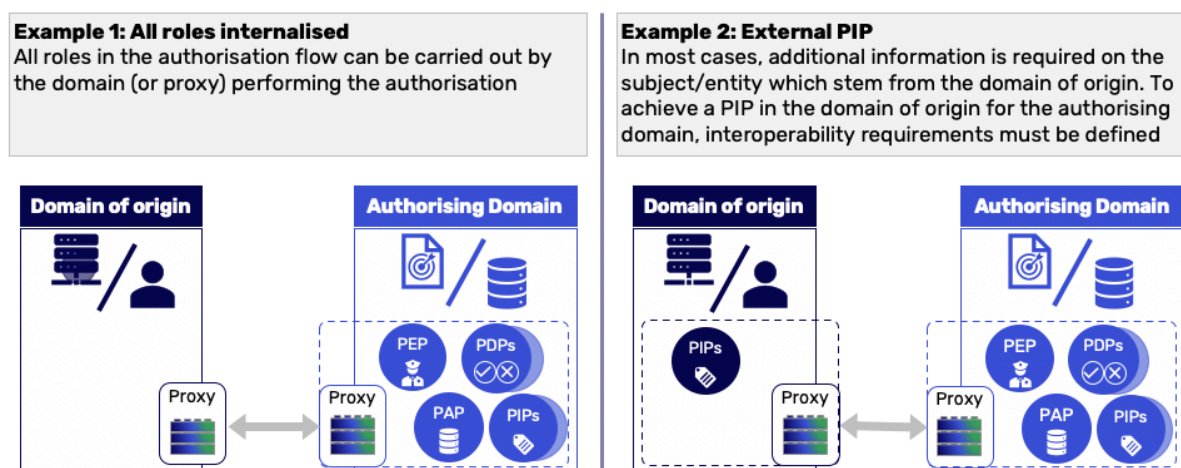

823 **Requirements needed to facilitate the distribution of Authorisation roles across domains**

824 The roles required for AUTHORISATION could be distributed across different DOMAINS to  
 825 enable CROSS-DOMAIN use cases. It is to be expected that the enforcement and  
 826 administration of policies will be located within the same DOMAIN, which in turn makes it  
 827 likely that the decision will also be made in the same DOMAIN. In the context of  
 828 AUTHORISATION, it therefore makes sense to refer to DOMAINS as administrative DOMAINS,  
 829 defined as the DOMAIN where policies are administrated and enforced.

830  
 831 How an AUTHORISATION decision is reached within a DOMAIN can be the result of many  
 832 (partial) decisions reached by different components within the DOMAIN, However, the PDP  
 833 combines all partial decisions to a final decision. The details of how this is achieved is out  
 834 of scope for the future CROSS-DOMAIN TRUST FRAMEWORK as it is the responsibility of a  
 835 single DOMAIN.

836  
 837 If use cases arise where it is necessary to out-source any of these AUTHORISATION roles  
 838 to other DOMAINS, this will be further investigated to be included in the future Cross-  
 839 Domain TRUST FRAMEWORK. For now, this means the two most likely role distributions are  
 840 as shown in Figure 16.

841

842  
 843

Figure 16: Most use cases can be captured in two different Authorisation role distributions

844 When all the roles for AUTHORISATION can be realised within a DOMAIN (example 1 in Figure  
 845 16), there is no need for additional INTEROPERABILITY requirements. However, in the case  
 846 of example 2 in Figure 16 where a role is located in another DOMAIN, or even outside of  
 847 either DOMAIN, INTEROPERABILITY requirements are needed to enable this. Therefore,  
 848 further investigation must be done into the following elements to be included in the TRUST  
 849 FRAMEWORK:

- 850 • Language must be created to exchange AUTHORISATION data and attributes in  
 851 order to transact,
- 852 • Trust is needed between DOMAINS regarding the sharing of AUTHORISATION  
 853 attributes,
- 854 • Technical standards are needed to enable communication of attributes.

855

856 6.3.5 Authorisation flows

857 There are two possibilities for the AUTHORISATION flow which are most likely to be needed  
 858 to enable DATA SHARING: the Pull and Push AUTHORISATION sequence, as identified in RFC  
 859 2904 (source: <https://tools.ietf.org/html/rfc2904>). Both AUTHORISATION sequences can  
 860 be used for any type of DATA SERVICE model. Therefore, they can be considered  
 861 independently from each other.

862  
 863 Pull Authorisation sequence

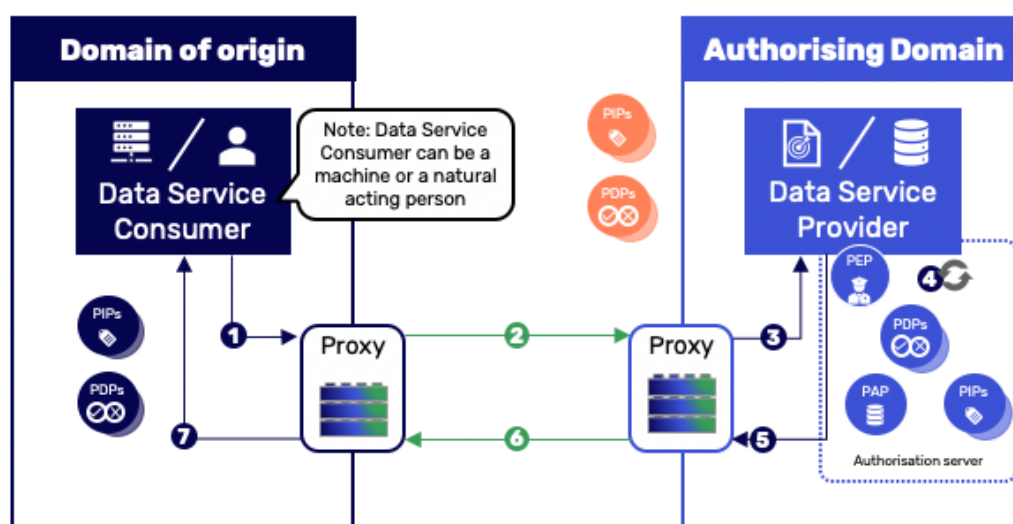

864 In a pull AUTHORISATION sequence, the PEP pulls the AUTHORISATION decision from the  
 865 PDP in the authorising DOMAIN. See Box 5 for more information on the pull  
 866 AUTHORISATION sequence.

867

868 **Box 5: Illustration of Pull Authorisation sequences in the proxy model**

869 Figure 17 shows the PROXY interaction for a push AUTHORISATION sequence.

870

871

Figure 17: Proxy interaction for a pull authorisation model

872

- 873 1. The DATA SERVICE CONSUMER sends a request for a DATA SERVICE to the DOMAIN of
- 874 Origin PROXY (including DATA SERVICE CONSUMER information for AUTHORISATION)
- 875 2. The DOMAIN of Origin PROXY translates the request and forwards it to the
- 876 Authorising DOMAIN PROXY
- 877 3. The Authorising DOMAIN PROXY translates the request and forwards it to the
- 878 Authorising DOMAIN
- 879 4. Authorising DOMAIN receives the request, processes it and the PDP takes the
- 880 appropriate decision. The decision can be based on information and (sub) decisions
- 881 received from outside of the Authorising DOMAIN.
- 882 5. The DATA SERVICE PROVIDER PEP provides access and DATA SERVICE PROVIDER
- 883 directly performs the action and sends back the result to the Authorising DOMAIN
- 884 PROXY
- 885 6. The Authorising DOMAIN PROXY translates the results and forwards the result of the
- 886 action to the DOMAIN of Origin PROXY
- 887 7. The DOMAIN of Origin PROXY translates the results and forwards the result of the
- 888 action to the DATA SERVICE CONSUMER

889  
 890 Note: RFC 2904 additionally identifies the agent AUTHORISATION sequence. From an  
 891 INTEROPERABILITY perspective, this can be considered the same as the pull sequence, as  
 892 this only impacts how the decision is made in step 4.  
 893

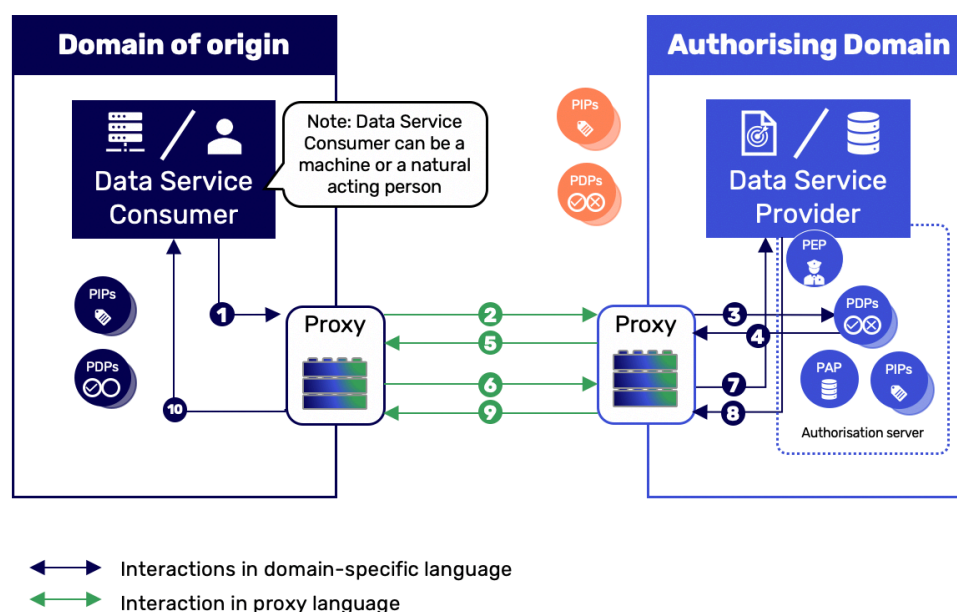

894 An example of an AUTHORISATION pull is when a Dutch citizen authorises a family  
 895 member to perform their tax declaration using the NL mandate registry for citizens,  
 896 DigiD Machtigen. The citizen has to authorise the family member in advance at DigiD  
 897 Machtigen, where this information is stored. The family member can then log in at the  
 898 tax authority using their DigiD. The tax authority determines that they can perform the  
 899 tax declaration based on an AUTHORISATION pull from DigiD Machtigen.

900  
 901 **Push Authorisation sequence**

902 In a push AUTHORISATION sequence, the PEP gets pushed an AUTHORISATION decision that  
 903 the DOMAIN of Origin has received from the PDP. See Box 6 for more information on the  
 904 push AUTHORISATION sequence.  
 905

906 **Box 6: Illustration of Push AUTHORISATION sequences in the proxy model**

907 Figure 18 shows the PROXY interaction for a push AUTHORISATION sequence.

908  
 909 *Figure 18: Proxy interaction for a push authorisation sequence*

- 910
- 911 1. The DATA SERVICE Consumer sends an AUTHORISATION request for a DATA SERVICE
  - 912 action to the DOMAIN of Origin proxy (including DATA SERVICE CONSUMER information
  - 913 for AUTHORISATION and user redirect for consent, if necessary)
  - 914 2. The DOMAIN of Origin PROXY translates the AUTHORISATION request and forwards it to
  - 915 the Authorising DOMAIN PROXY (including information and redirect)
  - 916 3. The Authorising DOMAIN PROXY translates the AUTHORISATION request and forwards
  - 917 it to the PDP in the Authorising DOMAIN (including information and redirect)
  - 918 4. PDP takes the appropriate decision and responds with the decision to the
  - 919 Authorising DOMAIN PROXY. The decision can be based on information and (sub)
  - 920 decisions received from outside of the authorising DOMAIN.

- 920 5. The Authorising DOMAIN PROXY sends the decision to the DOMAIN of Origin PROXY  
 921 6. The DOMAIN of Origin PROXY sends a DATA SERVICE request (including decision) to the  
 922 Authorising DOMAIN PROXY  
 923 7. The Authorising DOMAIN PROXY forwards the request to the DATA SERVICES PROVIDER  
 924 (including decision) where the PEP validates the decision and provides access  
 925 8. The DATA SERVICE PROVIDER performs the action and sends the result to the  
 926 Authorising DOMAIN PROXY  
 927 9. The Authorising DOMAIN PROXY translates the results and forwards the result to the  
 928 DOMAIN of Origin PROXY  
 929 10. The DOMAIN of Origin PROXY translates the results and forwards the result of the  
 930 action to the DATA SERVICE CONSUMER  
 931

932 An example of an AUTHORISATION push is the OAuth 2.0 protocol in which users are  
 933 redirected to provide consent for requests to access. This results in a long-term access  
 934 token which can be used for the DATA SERVICE transactions. The DATA SERVICE request  
 935 includes the token and therefore, the AUTHORISATION is pushed. These mechanisms are  
 936 common to IoT setups and can be found in access control for home smart meters for  
 937 electricity. The energy provider receives access to the home smart meter, based on a  
 938 one-time consent of the user, on which the network operator (the owner of the  
 939 metering infrastructure) issues an access token that can be used for all future requests  
 940 for data.

941

### 942 6.3.6 Delegated Authority

943 DELEGATION is the provision of explicit rights (to perform an action) to a third party. There  
 944 are a number of different cases where DELEGATION of authority is required, such as:

- 945 • Companies cannot perform actions themselves and a service/employee must  
 946 perform this on their behalf.
  - 947 • Natural persons, on behalf of companies, interact with other companies,  
 948 such as non-standardised interactions using a web browser.
  - 949 • Machines, on behalf of companies, interact with other companies, such as  
 950 PKI Overheid (this is implicit DELEGATION of the machine, allowing machines  
 951 to act for the company).
- 952 • Companies may delegate rights to other companies so that the other company  
 953 can perform actions on their behalf in another DOMAIN.
- 954 • Natural persons may give consent to another natural person to perform an action  
 955 on their behalf, such as a colleague performing an action for you.

956

957 Therefore, DELEGATION of authority must be specified within the TRUST FRAMEWORK. Two  
 958 types of DELEGATION have been identified: pre-configured, and ad-hoc DELEGATION.

#### 959 1. Pre-configured Delegation

- 960 • Pre-configured DELEGATION occurs well before the DATA SERVICE action takes  
 961 place and is usually long lasting.
- 962 • Examples of pre-configured DELEGATION can be seen in iShare, where  
 963 delegation policies can be managed/stored in authorisation registries which  
 964 can be consulted at any time during data requests to provide authorisation.  
 965 Another example is in the “Sharing e-CMR data with insurers” use case, in

966 which an insurer can be mandated by a shipper to retrieve data from the e-  
967 CMR on their behalf.

## 968 **2. Ad-hoc Delegation**

- 969 • Ad-hoc DELEGATION occurs as the DATA SERVICE action is being performed and  
970 lasts for that single context.
- 971 • An example of ad-hoc DELEGATION can be seen in the “Green Loans” use case  
972 in which mortgages can be provided based on energy usage data. The  
973 mortgage intermediary can be granted access to the energy usage of a  
974 consumer to prepare a quotation for a mortgage.

975

### 976 [Communication required to validate pre-configured delegation](#)

977 In pre-configured DELEGATION, the delegator gives consent for the delegatee in a single  
978 DOMAIN. The delegatee can be given consent for generic rights, or rights to perform a  
979 specific action. The delegator does not know if the delegatee made use of the delegated  
980 rights and when or how they were used. Once the DELEGATION is performed, this must be  
981 stored within the DOMAIN where this occurred and the delegatee is free to perform the  
982 action they were given consent for.

983

984 The process of pre-configured DELEGATION all takes place within a single DOMAIN and  
985 therefore, there is no need for INTEROPERABILITY requirements regarding the act of  
986 DELEGATION. Furthermore, if pre-configured DELEGATION takes place within the  
987 Authorising DOMAIN, there is no need for additional INTEROPERABILITY requirements as  
988 there is no need to communicate AUTHORISATION data across DOMAINS.

989

990 If pre-configured DELEGATION takes place within the DOMAIN of Origin, this must be  
991 communicated to the authorising DOMAIN during a DATA SERVICE transaction. The TRUST  
992 FRAMEWORK must facilitate a method to communicate this DELEGATION across DOMAINS.  
993 Furthermore, a method for the Authorising DOMAIN should be defined to validate the  
994 DELEGATION performed.

995

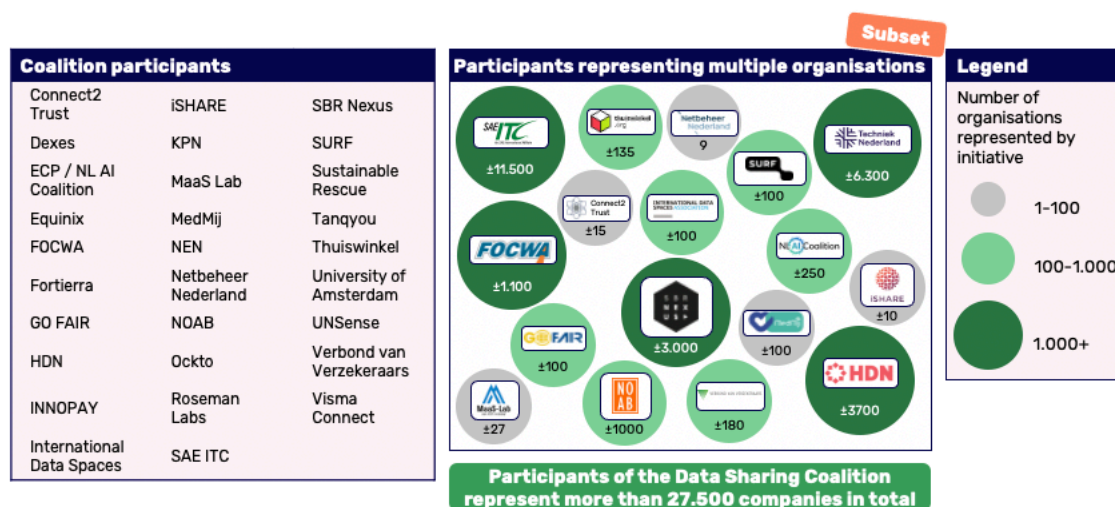

### 996 [User experience requirements facilitate Ad-hoc Delegation](#)

997 In Ad-hoc DELEGATION, the delegatee is given specific rights to perform a DATA SERVICE  
998 action only during the transaction. The delegator knows that the delegatee made use of  
999 the delegated rights during only that transaction context. In this case, AUTHORISATION  
1000 must take place within the Authorising DOMAIN. In order to facilitate this, proxies should  
1001 include UX requirements for H2M interaction to facilitate an actor delegating consent  
1002 across DOMAINS.

1008 **8 Interoperability and harmonisation**

1009 **8.1 Steps to reach a data service transaction agreement**

1010 In a DATA SERVICE TRANSACTION AGREEMENT between a DATA SERVICE CONSUMER and a DATA  
 1011 SERVICE PROVIDER, POLICIES apply. See Figure 20.

1012 *Figure 20: Terms and Conditions in a Data service transaction agreement.*

1013 A DATA SERVICE TRANSACTION AGREEMENT is an agreement (handshake) between a DATA  
 1014 SERVICE CONSUMER and PROVIDER on the terms and conditions associated with a specific  
 1015 data transaction. An agreement is achieved through the following five steps:

- 1016 1. A DATA SERVICE PROVIDER publishes its DATA SERVICE including all POLICIES.
- 1017 2. A DATA SERVICE CONSUMER requests a DATA SERVICE (API call) and provides  
 1018 evidence of adherence to ACCESS CONTROL RULES.
- 1019 3. The DATA SERVICE PROVIDER evaluates the evidence and executes the requested  
 1020 DATA SERVICE based on the result of this evaluation.
- 1021 4. The DATA SERVICE PROVIDER confirms the DATA SERVICE TRANSACTION AGREEMENT.
- 1022 5. The DATA SERVICE PROVIDER executes the DATA SERVICE while both DATA SERVICE  
 1023 PROVIDER and DATA SERVICE CONSUMER provide evidence of adherence OBLIGATION  
 1024 AND ADVICE POLICIES.

1025  
 1026  
 1027 These steps hold for all types of DATA SERVICES (e.g. data pull/push, bring algorithm to  
 1028 data, see Table 3).

1030 **Box 8: Steps to reach a data service transaction agreement in the energy domain**

1031 Within the energy DOMAIN, the energy provider (DATA SERVICE CONSUMER) wants to make  
 1032 use of energy consumer data (e.g. on energy usage), which is currently in possession of

1033 the DSOs (DATA SERVICE PROVIDER). DSOs enable energy providers to access consumer  
 1034 data through publishing their DATA SERVICE, including all POLICIES that the energy  
 1035 provider should adhere to. Only with consent of the consumer can the energy provider  
 1036 access the consumer's energy data. The energy provider needs to identify the energy  
 1037 producer and the DSO authenticates the identity of the energy producer. In addition, the  
 1038 DSO evaluates the evidence of adherence to other POLICIES of the energy provider,  
 1039 before providing energy provider access to the consumer data. Both the energy  
 1040 provider and the DSO have agreed on the POLICIES both should adhere to and access will  
 1041 be provided.

1042

## 1043 **9 Terms and Conditions**

### 1044 **9.1 Terms and Conditions in DSC use cases**

1045

1046 *Note: More detail in Box 9 will be included when more use cases have been initiated and*  
 1047 *current use cases have been developed further.*

1048

#### 1049 **Box 9: Terms and conditions in DSC use cases**

1050

1051 Different TERMS AND CONDITIONS are relevant in the use cases in which the DSC is  
 1052 involved. Below, indicative and non-exhaustive lists of TERMS AND CONDITIONS  
 1053 (formalised into POLICIES) within these use cases are shown.

1054

#### 1055 **Example Policies in 'Green Loans' use case (HDN - Netbeheer NL)**

1056

ACCESS CONTROL RULES:

1057

- 1058 • Identity of consumer must be verified at the appropriate Level of Assurance that matches the risk-context of the transaction
- 1059 • There must be reasonable certainty that the EAN-code (smart meter identifier) for which data is requested belongs to the consumer's smart meter
- 1060 • Identity Intermediary must be certain
- 1061 • Intermediary must have unique identifier
- 1062 • DSO must be able to verify that intermediary is "Trustworthy"
- 1063 • Consumer AUTHORISATION must be linked to identifier of intermediary
- 1064 • Purpose of data requested must match the operations of the intermediary

1066

ADVICE AND OBLIGATION:

1067

- 1068 • Scope of usage is the "bemiddelingsproces", which includes sending (subset of) data to banks
- 1069 • Data may not be altered and must maintain "seal of validity"
- 1070 • Time to live is maximum of 24 months

1071

#### 1072 **Example Policies in 'Sharing e-CMR data with insurers' use case (iSHARE - Verbond van Verzekeraars)**

1073

ACCESS CONTROL RULES:

1075

- 1076 • Access rights of the insurer must be registered by the claim issuer in an Authorisation Registry
- 1077 • AUTHORISATION is granted based on DELEGATION evidence provided by claim issuer to the e-CMR provider

1078

- 1079 • Parties must either be an organisation with delegated data access or the owner of
- 1080 the data
- 1081 • Parties must provide a qualified eIDAS (or PKIOverheid) certificate for
- 1082 AUTHENTICATION
- 1083 **ADVICE AND OBLIGATION:**
- 1084 • Scope of usage is the claims handling process
- 1085 • Licenses indicate for which purposes the (subset of) shipment data may be used
- 1086 (e.g. no limitations, non-commercial use only, for own use only)
- 1087 • Time to live of shipment data points at insurer can be set to a maximum by the
- 1088 claim issuer

## 9.2 Initial Policy clusters and examples of Policies

POLICY clusters are sets of POLICIES. The overview below shows preliminary POLICY clusters. This overview is based on the input that is provided by the DATA SHARING INITIATIVES in the DSC and input provided in Expert Group discussions. This overview of clusters is not exhaustive but serves as an example to be used as a starting point for the next phase of the DSC. These clusters may be subject to change in the next phase. This first set-up distinguishes clusters on its type of POLICIES: ACCESS CONTROL RULES and ADVICE AND OBLIGATION (both usage and other).

Table 7: Overview of clusters and types of POLICIES

Cluster	Policies	Type
Scope	Time to live	OBLIGATIONS AND ADVICE: Usage
	Usage scope	OBLIGATIONS AND ADVICE: Usage
	Propagation restrictions	OBLIGATIONS AND ADVICE: Usage
	Third party use of data	OBLIGATIONS AND ADVICE: Usage
	Usage based on geography	OBLIGATIONS AND ADVICE: Usage
	Target binding	OBLIGATIONS AND ADVICE
AUTHORISATION	Access management	ACCESS CONTROL RULES
	Delegated rights	ACCESS CONTROL RULES
AUTHENTICATION	Multi-factor AUTHENTICATION	ACCESS CONTROL RULES
	Supported e-ID means	ACCESS CONTROL RULES
	Identity confirmation mechanism	ACCESS CONTROL RULES
Liabilities	Indemnification	OBLIGATIONS AND ADVICE
Privacy (pre)	Privacy Impact Assessments	ACCESS CONTROL RULES
	Risk analysis	ACCESS CONTROL RULES
Privacy (post)	Anonymisation	OBLIGATIONS AND ADVICE
	Right to be forgotten	OBLIGATIONS AND ADVICE
Information classification	Data classification scheme	ACCESS CONTROL RULES

Cluster	Policies	Type
Information access	Access management protocol	ACCESS CONTROL RULES
	Separation of functions	ACCESS CONTROL RULES
	User access rights audit	ACCESS CONTROL RULES
Operational conditions	Data minimalisation	OBLIGATIONS AND ADVICE
	Testing requirement	OBLIGATIONS AND ADVICE
	Data breach notification(s)	OBLIGATIONS AND ADVICE
Provenance	Obligated provenance	OBLIGATIONS AND ADVICE
Data storage	Data retention period	OBLIGATIONS AND ADVICE
	Data deletion evidence	OBLIGATIONS AND ADVICE
	Encryption of stored data	OBLIGATIONS AND ADVICE
	Back-up retention period	OBLIGATIONS AND ADVICE
	Cryptographic key storage	OBLIGATIONS AND ADVICE
Non-repudiation	Digital signature requirement	OBLIGATIONS AND ADVICE
Laws and regulations	Declaration of adherence to law	ACCESS CONTROL RULES
	Applicable law	ACCESS CONTROL RULES
	GDPR compliance	ACCESS CONTROL RULES
Information security	Confidentiality	OBLIGATIONS AND ADVICE
	Integrity	OBLIGATIONS AND ADVICE
	Authenticity	OBLIGATIONS AND ADVICE
Geographical information	Data processing outside of EU	OBLIGATIONS AND ADVICE
Employee qualifications	IT officer assignment	ACCESS CONTROL RULES
	Employee competency declaration	ACCESS CONTROL RULES
	Employee screenings	ACCESS CONTROL RULES
Supervision	Monitoring	All
	Enforcement	All
	Arbitrage and dispute settlement	OBLIGATIONS AND ADVICE

1100

1101 9.2.1 Longlist of metadata languages for Policies

1102

1103 *Note: More detail on the contents of this chapter will be included when the topic*  
 1104 *metadata has been discussed in more detail. This longlist is not exhaustive.*

1105

1106 Different metadata languages exist of which some are specifically developed for TERMS  
 1107 AND CONDITIONS. These metadata languages enable coherent communication across

1108 sectors on TERMS AND CONDITIONS and hence, examples (see below) are discussed in this  
1109 chapter.

1110

1111 DCAT/ODRL

1112 DCAT is a worldwide W3C metadata standard, applied by the Dutch government among  
1113 others. In the newest version of DCAT, datasets can be enriched with conditions for DATA  
1114 SHARING. ODRL is the standard for the description of these conditions.

1115

1116 eFlint

1117 eFlint is a standard meant to make the structure and meaning of legal documents  
1118 “machine readable”.

1119

1120 Akomo Ntoso

1121 Akomo Ntoso is an open standard meant to make the structure and meaning of legal  
1122 documents “machine readable”.

1123

1124 RDF

1125 RDF (Resource Description Framework) is a standard for data exchange, developed by  
1126 W3C.

## 1127 **10 Manifestation of topics in the Trust Framework**

1128 The common agreements that will be made by the DATA SHARING COALITION will be  
 1129 captured in one comprehensive document, the future Cross-Domain Trust Framework.  
 1130 The document will specify agreements and requirements that DATA SHARING DOMAINS  
 1131 should adhere to. Every topic that has been discussed in this HARMONISATION CANVAS will  
 1132 become part of the future TRUST FRAMEWORK and will be analysed across five disciplines:  
 1133 Business, Legal, Operational, Functional and Technical (BLOFT).

1134

1135 *Note: More detail on the contents of this chapter will be included when more topics*  
 1136 *have been discussed, to enable uniformity on the manifestation in Trust Framework*  
 1137 *across different topics.*

1138

### 1139 **10.1 Terms and conditions**

1140 The topic TERMS AND CONDITIONS will be discussed in all BLOFT dimensions (Business,  
 1141 Legal, Operational, Functional and Technical) as it is connected to multiple different  
 1142 topics (e.g. IAA, metadata, business model). The general outline of the topic will be  
 1143 discussed in the Functional part of the BLOFT dimensions of the future CROSS-DOMAIN  
 1144 TRUST FRAMEWORK, as how organisations have to deal with and handle conditions is a  
 1145 functional aspect.

1146

1147 Steps to take in the next phase to come to agreements for the future CROSS-DOMAIN  
 1148 TRUST FRAMEWORK are/can be:

- 1149 • Make implicit TERMS AND CONDITIONS more explicit.
- 1150 • Finalise TERMS AND CONDITIONS clusters.
- 1151 • Create levels for TERMS AND CONDITIONS clusters.
- 1152 • Decide on metadata language for TERMS AND CONDITIONS.

1153

### 1154 **10.2 Identification, Authentication and Authorisation**

1155 The general outline of the topic will be discussed in mainly the Functional and Technical  
 1156 part of the BLOFT dimensions of the TRUST FRAMEWORK, as these are the most important  
 1157 topics regarding how organisations have to deal with and handle IDENTIFICATION,  
 1158 AUTHENTICATION and AUTHORISATION.

1159

1160 Steps to take in the next phase for the TRUST FRAMEWORK in working towards agreements  
 1161 are/can be:

- 1162 • Include explicit definitions for identifier prefixes.
- 1163 • Define standard LoAs based on eIDAS.
- 1164 • Further investigate and define usage of Qualified Trust Services.
- 1165 • Define interoperable UX standards.
- 1166 • Define requirements needed to facilitate the distribution of AUTHORISATION  
 1167 roles across DOMAINS.
- 1168 • investigate and define a method of validating Pre-configured DELEGATION.
- 1169 • Discuss and define the redirects and user interface requirements needed for  
 1170 interoperable human to machine AUTHENTICATION.
